Description

Short Chemring PLC: A Pitch on Chaffs, Countermeasures and C4

Elevator Pitch

We are short Chemring PLC, a defense manufacturer with a market capitalization of approximately £1.5 billion, because we believe the sell side has materially misunderstood the trajectory of both operating segments and continues to extrapolate growth that the underlying contract data does not support. In countermeasures, management repeatedly claims a 65% market share, and both investors and analysts have anchored to that figure when projecting the business forward. Our mapping of more than 760 US countermeasures contracts demonstrates that the figure is constructed on the principle of cumulative incumbency rather than current performance, and that Chemring's share of new US awards has collapsed to 0% in 2026 to date as TransDigm has taken the business. We also believe the sell side is massively underestimating the penetration of DIRCM over the next five to six years, which is displacing expendable countermeasures across the rotary-wing, transport and tanker fleets that account for approximately half of the addressable market, and that this displacement materially outweighs both the mix shift toward costlier spectral flares and the demand created by donations to Ukraine. In energetics, management has guided to increasing capacity at its Sætre plant by up to 275% without specifying which products that figure applies to. Norwegian emissions filings confirm that the expansion applies only to HMX, while RDX capacity remains unchanged, which means that Chemring is committing its entire incremental capacity to a single German artillery framework at precisely the point when Rheinmetall, Nitro-Chem and Eurenco are aggressively expanding RDX capacity to serve the loitering-munitions market. Despite all of this, no analyst covering the company currently maintains a sell recommendation.

Business Overview

Chemring has two principal reporting segments: Countermeasures & Energetics and Sensors & Information. Within Countermeasures, the company manufactures flares and chaff, which are conventional decoys commonly referred to as expendable countermeasures. Energetics, which we estimate now represents approximately 60% of Countermeasures & Energetics revenue, consists of two principal activities. The first is the manufacture of high-value energetic components for precision-guided munitions, primarily missiles such as AMRAAM, Patriot, Thales Martlet among others. The second is the manufacture of military-grade explosive materials. Within missile components, Chemring manufactures four principal product categories: squibs, initiators, actuators and fuzes. On the GBU-57 Massive Ordnance Penetrator, for example, we estimate that Chemring contributes approximately \$57,000 of content per unit, demonstrating that the company's economic exposure to a program can be substantial despite the relatively small physical size of the components supplied. The second major component of the energetics business is the manufacture of explosives. Chemring's explosive portfolio is centered on RDX and HMX, both of which are produced through the Bachmann process. RDX is Chemring's primary volume product, while HMX is produced alongside it through the Bachmann process and is the more specialized, higher-value explosive. Both are high-energy explosives, and Chemring has also used them to develop a proprietary product called MCX, which combines HMX and RDX with NTO and other chemical inputs.

Across Countermeasures & Energetics as a whole, raw materials account for about 30% of the blended cost base. Employee expenses represent a further approximately 40%, making labor the most important cost category outside direct materials. Most of Chemring's costs are not raw-material costs, but employee expenses and fixed factory overheads. Chemring is therefore an exceptionally scale-sensitive business, a characteristic that the sell side broadly understands despite its shortcomings elsewhere in the analysis. A 10% increase in revenue can reasonably produce a 15% to 16% increase in operating profit because a large proportion of incremental revenue flows through after direct materials. This operating leverage is particularly important to the short thesis. Even where our revenue estimate differs from the sell side by only 3% to 4%, the corresponding difference in operating profit can be considerably larger because we also eliminate the incremental margin flow-through embedded in consensus estimates.

The second part of Chemring's business is Sensors & Information, which is the newer and more exciting part of the company. Sensors & Information currently accounts for approximately 25% of group revenue, compared with 75% from Chemring's conventional Countermeasures & Energetics business. The segment generated £174.8 million of revenue last year, of which approximately £153 million came from Roke, with the remainder generated by Chemring's US Sensors & Information operations.

Industry Overview

Within countermeasures, Chemring claims approximately 65% market share and states that it supplies roughly 80% of NATO armed forces. In the United States, its principal competitor is TransDigm through its Armtec subsidiary, alongside larger integrated defense contractors such as Northrop Grumman, which retain flare-manufacturing capabilities in-house. Over time, the United States and, by extension, the United Kingdom and Europe have shifted away from individual stand-alone contracts for flares and chaff toward large IDIQs or framework agreements. These contracts establish a ceiling, such as \$100 million, and remain open for a defined period that may extend for ten or fifteen years. There is no obligation to order the full amount, and governments seldom exhaust the entire framework value. In the first year, the military generally places an immense order at the lowest contractual price. From the second year onwards, orders begin to decline and can eventually trickle to almost nothing. Chemring, however, remains contractually obligated under government procurement rules to keep the relevant line open and ready to fulfill any future order placed under the agreement. Many of these contracts contain built-in price increases in later years, but those increases do not offset the deterioration in volume. Countermeasures are, as a whole, a numerically declining business for three principal reasons. The first is the growing use of loitering munitions, which reduces the need to place a human pilot directly into the battlefield. The second is the greater use of unmanned aerial vehicles such as the MQ-9 Reaper, which similarly reduces reliance on manned aircraft. The third structural pressure is DIRCM, or Directional Infrared Countermeasures. DIRCM replaces the expendable response of releasing flares with a reusable laser-

based system. DIRCM has increasingly been installed on helicopters, transport aircraft and aerial refueling tankers. Fighter aircraft are do not use DIRCM and are not expected to adopt it.

Moving on to the energetics part of the business, this is an exceptionally attractive market with substantial tailwinds and is a very good place for Chemring to be positioned. Within Western Europe, Chemring claims that it is one of only two suppliers of RDX, with Eurenco representing its principal competitor. Chemring provides almost no direct disclosure regarding its production capacity, customer allocations or competitive dynamics because this part of the business is exceptionally secretive. The two major tailwinds for energetics are loitering munitions and the depletion of US missile inventories. Governments globally have announced plans to manufacture approximately 10 million loitering munitions in 2026, with Ukraine alone targeting roughly 6.5 million units, and the stated intention is to sustain production at a similar level over the following years. However, to test the bear thesis at its hinge, we have incorporated all publicly announced production plans almost completely and assume delivery rates exceeding 90%. Loitering munitions require substantial quantities of explosive material. The continued expansion of loitering-munition production should consequently create significant incremental demand for RDX. The second major tailwind is the depletion of US missile inventories following the 2026 war with Iran. Although the conflict is continuing, inventories of the missiles containing Chemring components have already been depleted to below 50% of capacity across the relevant programs, with much of the remaining stock consisting of strategic reserves.

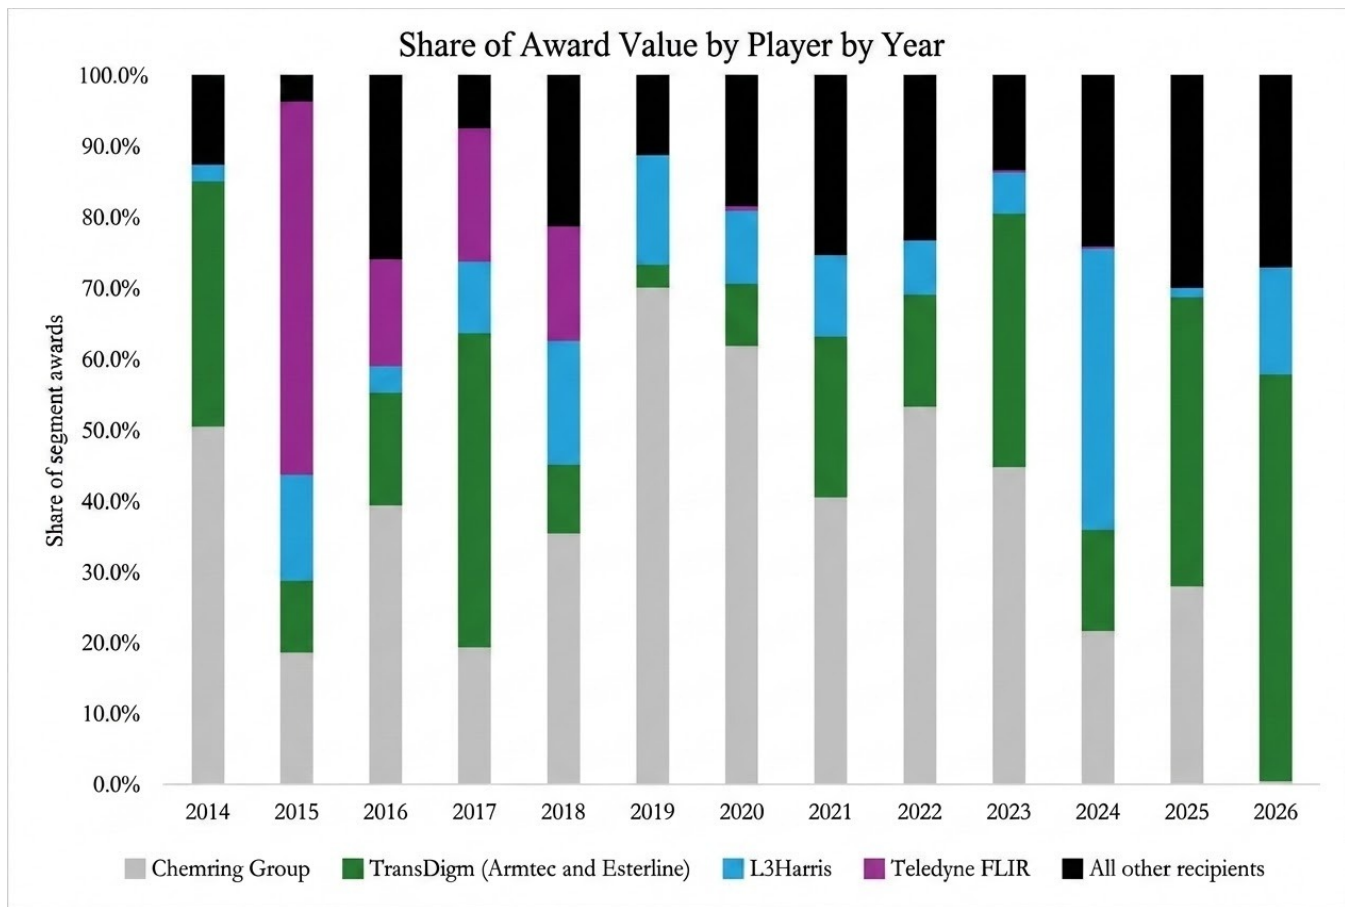

Diligence Stack & Analytical Edge: The diligence stack for this business was unusually comprehensive and is the principal source of our edge. Through the SAM.gov API and USAspending.gov API, I collected and mapped more than 760 US countermeasures contracts across over 20 attributes, aggregating every award over the past 16 years beginning in 2010, and mapped the full aircraft fleets of all four branches of the US military; and, because every subcontract worth more than \$30,000 must be publicly declared, a further 3,600 contracts by date, IDIQ structure, contract type and the amount of each contract that had or had not been filled, each matched against its parent contract. I reconstructed exact historical fleet numbers for approximately 25 of the 50 countries in which Chemring operates, which together account for more than 98% of the demand relevant to Chemring, using Cirium flight-traffic data and the IISS Military Balance workbooks, and deployed agentic AI to scrape news articles from Tier 1 institutions and military budgets to map their stated fleet plans across fighter aircraft, helicopters, transport aircraft and tankers. I then scraped every open opportunity and awarded contract relating to DIRCM systems, alongside US Department of Defense budget plans, to map DIRCM penetration across those same countries, and determined the number of flares carried by each aircraft and the pricing of each flare from government fact sheets, military aviation sources and relevant subreddits. I used the Kiel database API for all military donations to Ukraine since the beginning of the war in 2022, Norwegian environmental reports for Chemring's actual production capacities, Companies House APIs and Chemring Nobel's Norwegian statutory reports for subsidiary-level margins and cost structure, and filed six Freedom of Information Act requests on Roke.

Thesis 1: Chemring Countermeasures Has No Growth Prospects and Is Rapidly Losing Market Share

Chemring's Countermeasures business is being priced as if it still holds a dominant 65% market share and can continue growing through higher-priced flares and Ukraine, whereas the contract data shows that its US market share has completely collapsed, with no new awards in 2026. The 65% figure is based on historical incumbency and cumulative production rather than the share of new orders Chemring is currently winning, making it highly misleading. Even after using extremely liberal assumptions for Ukrainian aircraft deliveries, flare loads, utilisation and Chemring's market share, the resulting demand does not create meaningful upside. At the same time, rapid DIRCM adoption and the retirement of high-flare-density aircraft more than offset the mix shift toward expensive F-35 and Eurofighter Typhoon flares, resulting in a structurally declining Countermeasures SAM.

Thesis 1.1: Chemring USA Is Collapsing, and Management's Market Share Figures Are Misleading

Chemring's stated 65% Countermeasures market share is highly misleading because it is based on historical incumbency rather than the share of new orders it is currently winning. Our contract-level scrape shows that Chemring has lost an immense amount of US market share to TransDigm and has received no new US countermeasures awards in 2026. The only thing keeping the business alive is its legacy Kilgore backlog and the Alloy Surfaces intellectual-property arrangement. Once these roll off, Chemring has no visible pipeline or meaningful source of new US growth.

Our scraped contract data shows that Chemring has lost an immense amount of market share in the United States, yet management has never directly addressed either this deterioration or the extent to which its competitive position against TransDigm has weakened. As shown in the charts below, Chemring historically captured a sizeable proportion of US countermeasures awards and, in several years, held more than 50% market share. Since then, Chemring's share of new countermeasures awards has collapsed, reaching 0% in 2026 to date, while an increasing proportion of new business has been awarded to TransDigm.

The obvious question is how Chemring continues to generate US countermeasures revenue and retained an order book in H1 2026 despite receiving no new awards. This is because of existing awards to Chemring that remain in effect. On this basis, it still has an \$88.2 million executable order book for Kilgore Flares, which extends to the end of FY2027. The rest is an intricate intellectual-property transfer agreement involving Alloy Surfaces, Chemring's second US countermeasures facility alongside Kilgore Flares. Chemring had planned to close the Alloy Surfaces facility in April 2026, but the US government intervened and agreed to pay approximately \$45 million for the underlying intellectual-property rights associated with the flares manufactured there. The arrangement was structured to deliver roughly \$35 million of revenue annually over the following three years. This shows that the principal factor keeping Chemring alive in the US countermeasures market is its legacy intellectual property rather than its ability to win new business. Outside the Alloy Surfaces arrangement, it has less than \$100 million of order visibility in the United States. Despite this, I have still allocated Chemring a 15% to 20% market share, depending on my base or bull cases, which underscores how conservative these projections are.

This brings us to the elephant in the room: Chemring's repeated claim that it holds a 65% share of the countermeasures market, when the underlying picture could not be further from the truth. I tested the 65% claim by aggregating every award over the past 16 years, beginning in 2010, which produced a market share of 65.7%. Chemring does, however, repeatedly emphasize incumbency whenever it discusses its market share in its annual reports. Instead, it appears to calculate the figure on the principle of incumbency, based on the cumulative number of flares produced since its selected historical base year and the proportion of that cumulative production attributable to Chemring. While entirely legal, this is misleading in my view. It is comparable to Pan Am claiming that it accounts for more than 50% of US passenger traffic by incorporating its glory years during the 1980s, despite having done nothing since.

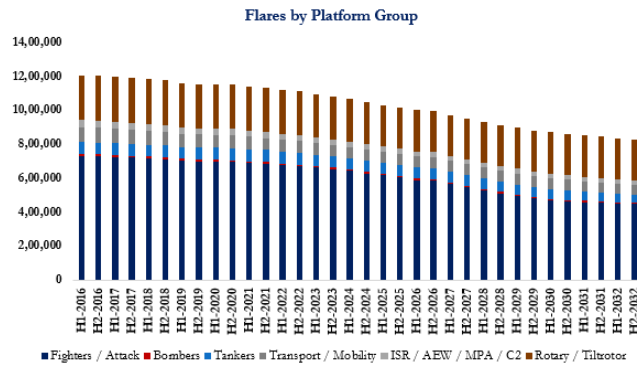

Thesis 1.2: DIRCM Adoption & Fleet Retirements > Mix-Shift to Costlier Flares & Ukrainian Demand

Across the board, the sell side models approximately 7% to 8% growth in countermeasures, based partly on management's thesis that the business is shifting toward higher-margin flares, as well as additional demand created by donations of F-16 fighters and Saab JAS 39 Gripen to Ukraine. However, we believe the sell side is significantly underestimating the adoption of DIRCM over the next five to six years and the impact of fleet retirements, while materially overestimating both the countermeasure demand created by Ukraine and the benefit from the mix shift.

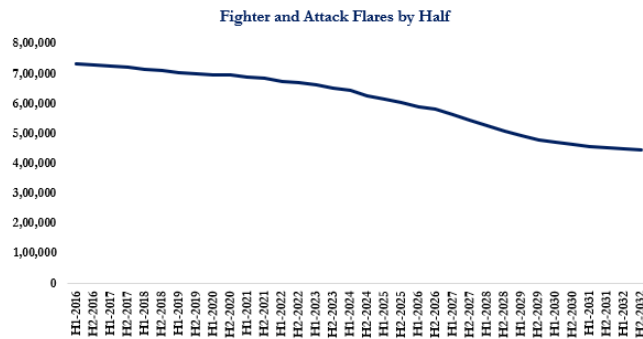

Scraping the entire Kiehl Database for Ukraine aid showed that 60% of pledged equipment is ultimately donated. Despite this, I have assumed a 75% delivery rate even in my bear case. Chemring has a better position in Ukraine than it does across the broader US market because it is the sole source of flares for the Saab JAS 39 Gripen, which is expected to be donated to Ukraine, however Ukraine has much closer ties to Chemring's competitor Lacroix Defence, the only Western Producer for countermeasures for Russian/Soviet Jets but I have assumed a 70% market share to remain conservative.

I assumed that every aircraft within Chemring's addressable fleet was loaded to its full conventional flare capacity, which is again highly liberal. For Ukraine, I assumed that each aircraft cycles through its full flare capacity approximately 9-10 times per year in both the base and bull cases. This means that Ukrainian

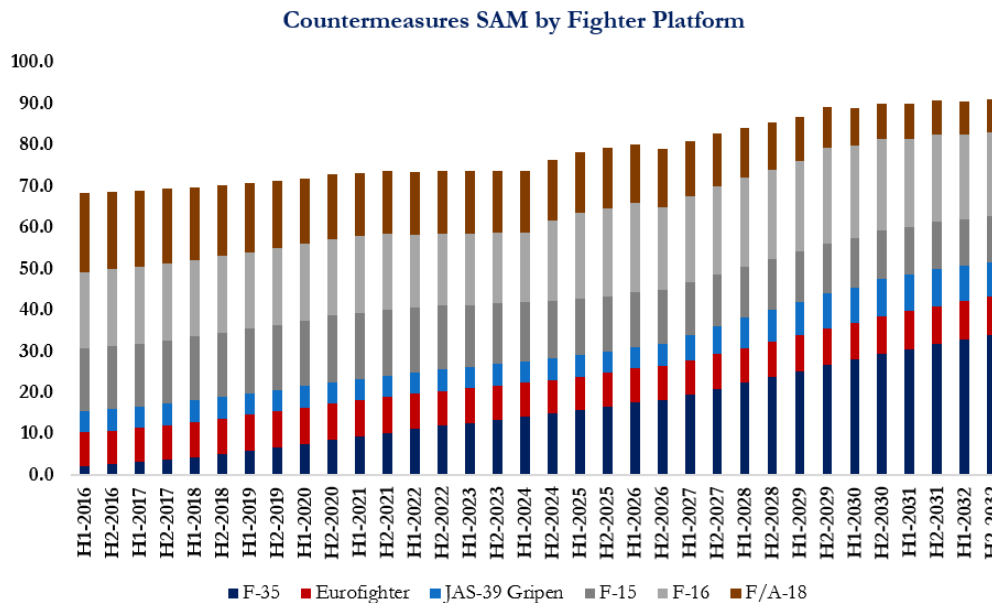

fighters are not only loaded with 500 flares each, but also consume over 5,000 flares per aircraft per year, which is absurdly generous and effectively implies that every Ukrainian fighter faces over 1,000 missile engagements per year. Even under these extreme assumptions, the resulting demand still does not create meaningful upside for the company. The reason is that the sell side is massively underestimating the penetration of DIRCM over the next 5-6 years.

The image above perfectly conveys the decline that will be broadly seen in flare numbers for almost all types of aircraft, including fighter and attack aircraft, which are broken down in detail below:

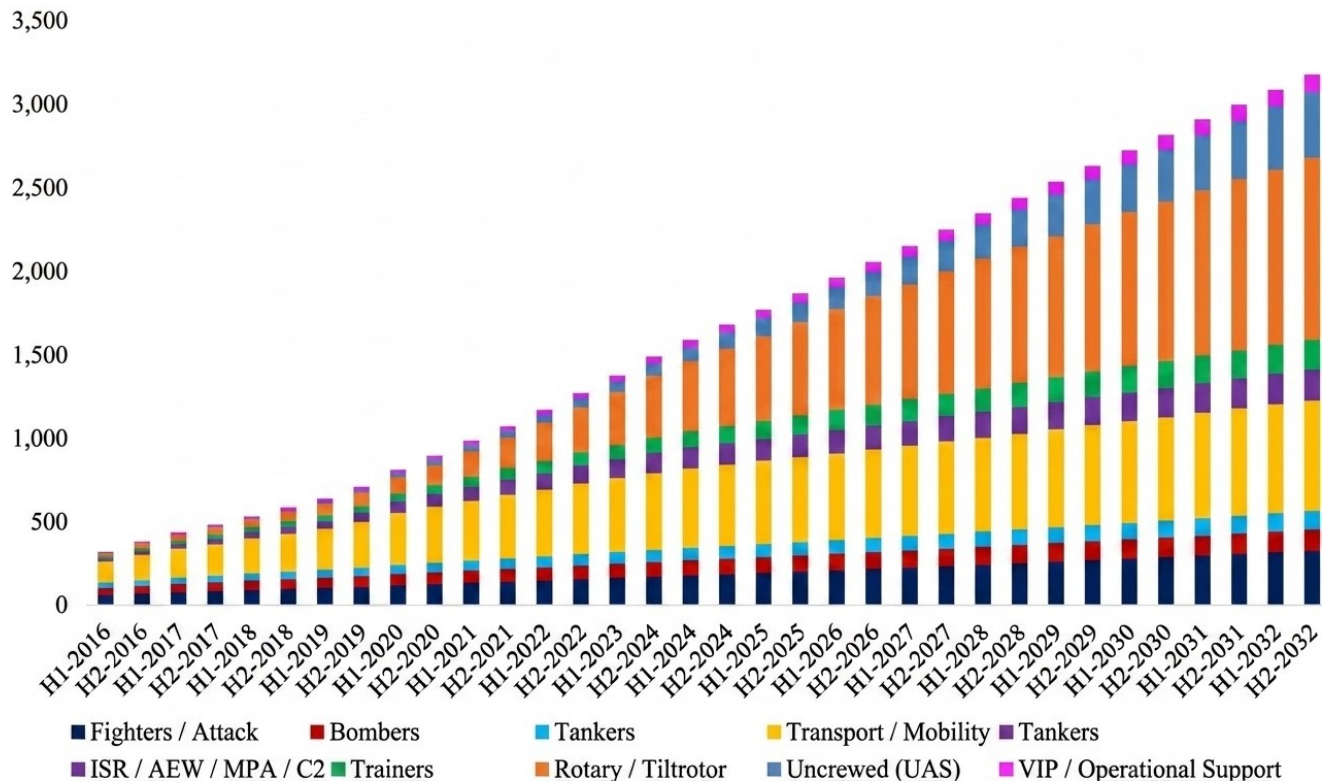

The massive decrease in the number of flares required by fighter and attack aircraft is mainly due to the fact that high-flare-density aircraft such as F-15s, F-16s, and F/A-18s are slowly being phased out in favor of more F-35s, Eurofighter Typhoons and UAVs. We totally agree with the fact that Eurofighter Typhoons, which have flares priced over \$500, and F-35s, whose flares are priced over \$2,500, could and will create a significant mix shift, as seen in our SAM calculation below.

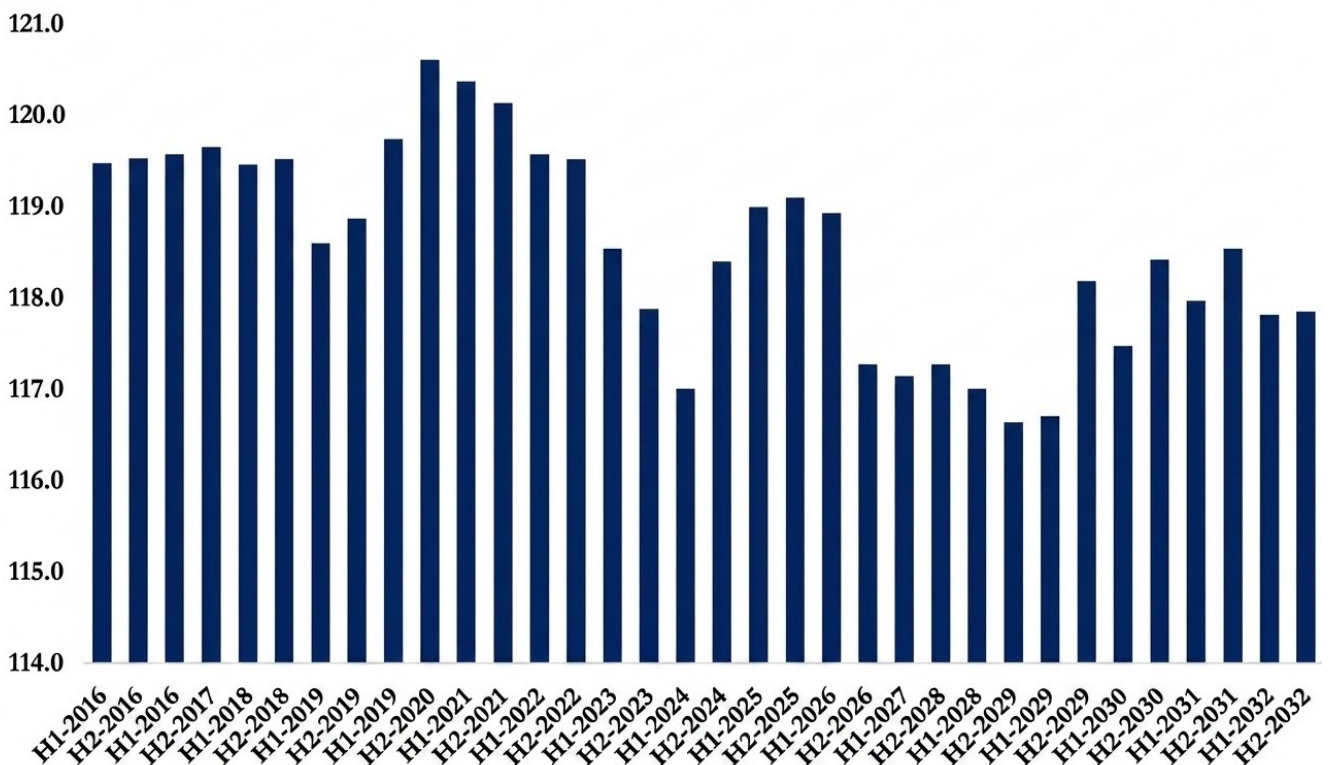

However, we believe that focusing on fighter fleet changes causes the entire DIRCM market to be overlooked. Our contract scrapes show that DIRCM adoption is increasing much faster than the shift in fighter numbers.

DIRCM Fitment by Platform Group

The flares used on aircraft where DIRCM is replacing conventional countermeasures, including rotary-wing, tiltrotor, transport and tanker platforms, are comparatively much cheaper than the spectral flares used on aircraft such as the Eurofighter Typhoon and F-35. However, the total number of these aircraft, as well as the number of flares they carry, far exceeds that of either the Eurofighter Typhoon or F-35. This results in an overall decline in the serviceable addressable market for countermeasures, as shown below.

Countermeasures SAM by Half

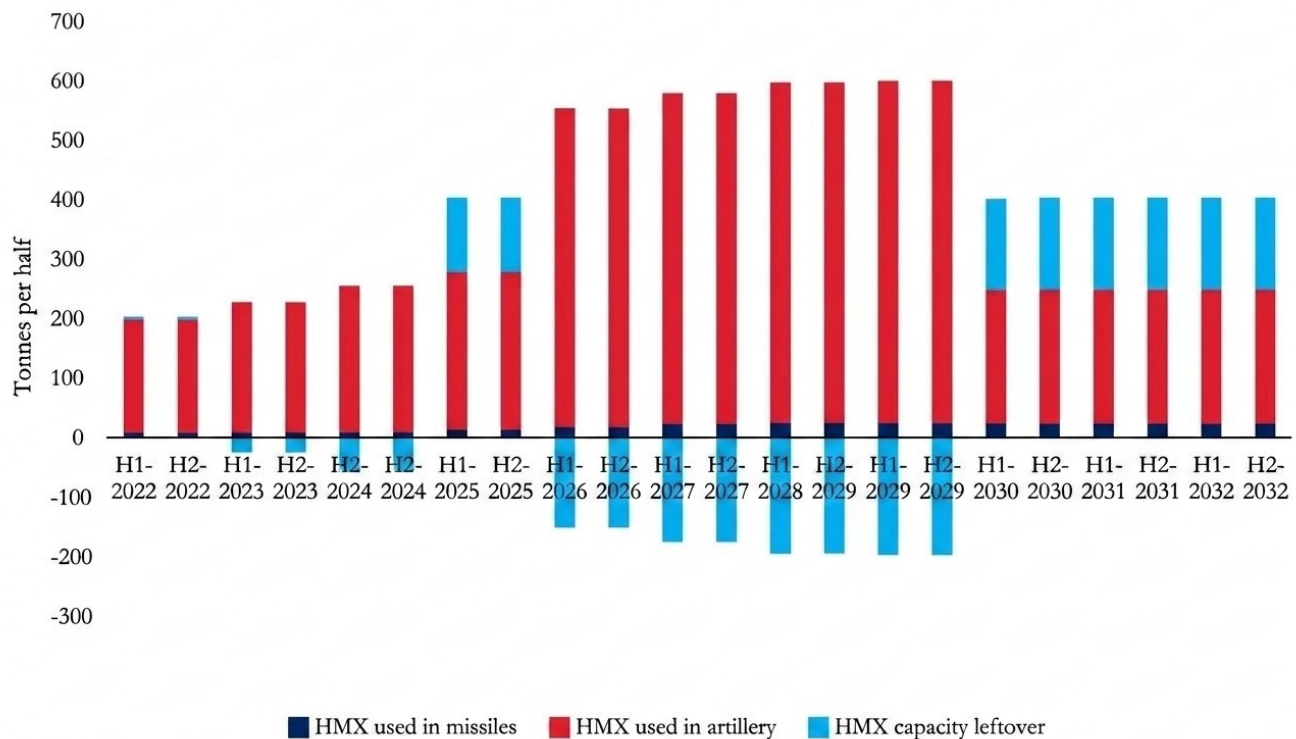

Thesis 2: Despite Tailwinds, Chemring's Energetics Growth Prospects Are Limited While the Sell Side Extrapolates

Despite the aforementioned massive tailwinds for the Energetics segment, we believe Chemring's growth prospects are severely limited by its disorganized capex plans and current order mix, which constrain it from pursuing high-growth segments. While this segment will grow in the future due to its immense order book and US rearmament following the depletion of missile stockpiles, we believe the sell side is forecasting too much growth too far into the future. It is failing to account for Chemring's poorly timed capital expenditure outlay compared to other players in the market.

Chemring's grand plan was to increase capacity at its Sætre plant in Norway by up to 275%. Given management's track record, I highly doubted that figure and examined the numbers myself. RDX, HMX and MCX are all produced through the Bachmann process, and because these are nitrogen-based compounds the process releases nitrogen emissions, which Norway's strict emissions regulations require companies to disclose. There is legitimate alpha in knowing Chemring's actual production capacities, because the company does not disclose them and likely never will. Management has never said that it is increasing total plant capacity by 275%. It has said that capacity will increase by up to 275%, without specifying which products that figure applies to. The emissions data confirmed my primary conclusion. Chemring is not increasing capacity across the entire plant. It is only doubling its nameplate capacity for HMX and NTO, which are used alongside RDX in the production of MCX, while RDX capacity is left unchanged. For the same quantity of raw material Chemring can produce approximately four times as much RDX as HMX, so on the same production line and the same planned investment it could have doubled its existing 1,600 tonnes of RDX and positioned itself to capture almost the entire market, because the entire loitering-munitions market is RDX-based. I then tracked where that HMX capacity was going. Chemring began pursuing the increase in H2 2024, approximately six months after announcing a contract win worth more than \$230 million, with Nammo and Diehl Defence, for the initial delivery of approximately 350,000 155 mm artillery shells to Germany. However, this was only the initial order. It forms part of an IDIQ or framework agreement covering a staggering 2.35 million shells, so Chemring's growth in this segment depends on whether that framework is utilised beyond the first order. There are only two ways in which it can be. Germany may sell the additional shells on to Ukraine, or Germany and its allies may draw on the framework to supply the rest of Europe. I have done the work to disprove both.

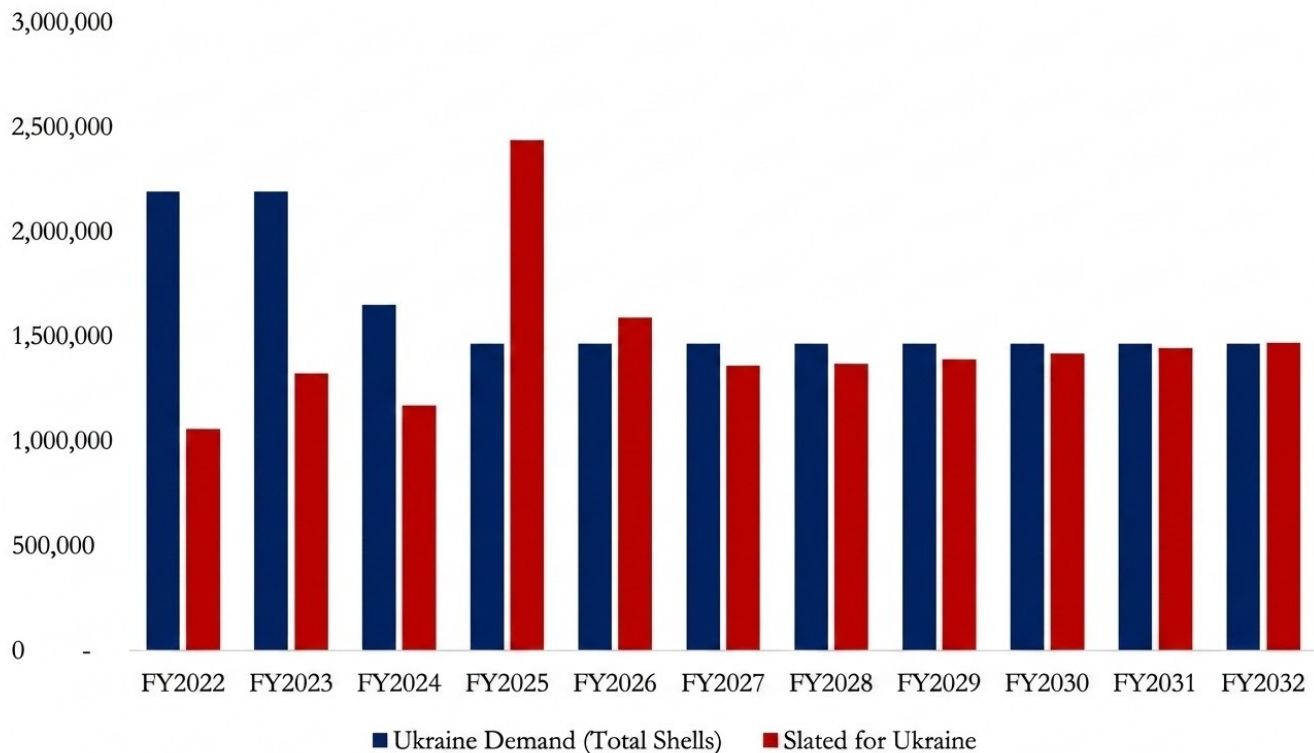

Chemring HMX Capacity Allocation, Missiles, Artillery and Leftover

The only capacity expansion revealed to date is the doubling of HMX capacity. Because we had constructed a complete SAM, we were able to triangulate exactly how many additional tonnes of HMX Chemring would need to fulfill these orders. The calculation produced 393.56 tonnes of incremental HMX demand, compared with a planned capacity expansion of 400 tonnes. The entire expansion is therefore committed to this single order.

The graph above, peaking at roughly 200 tons of HMX capacity per half required at peak, demonstrates the precision of the analysis. Germany's own requirement does not justify the framework. NATO has a measure called the Minimum Intensive Ammunition Demand, and the word "minimum" is misleading, because it effectively represents the maximum or ideal level of ammunition that a country should hold. On that basis Germany would need approximately 350,000 shells, so the Chemring-linked order alone is sufficient to meet its requirement, and Rheinmetall shells are already coming through under an €8.5 billion contract to 2030. Almost all of the excess ammunition is therefore intended for Ukraine, and because direct donations have largely come to a halt, countries now lend Ukraine money, which it must repay after the war and uses to buy ammunition from those same countries. To reduce this dependence, Ukraine has begun establishing substantial domestic capacity for 155 mm artillery shells. Our base case assumed utilization of 3,500 shells per day for all 365 days of the year through 2032, with no end to the war.

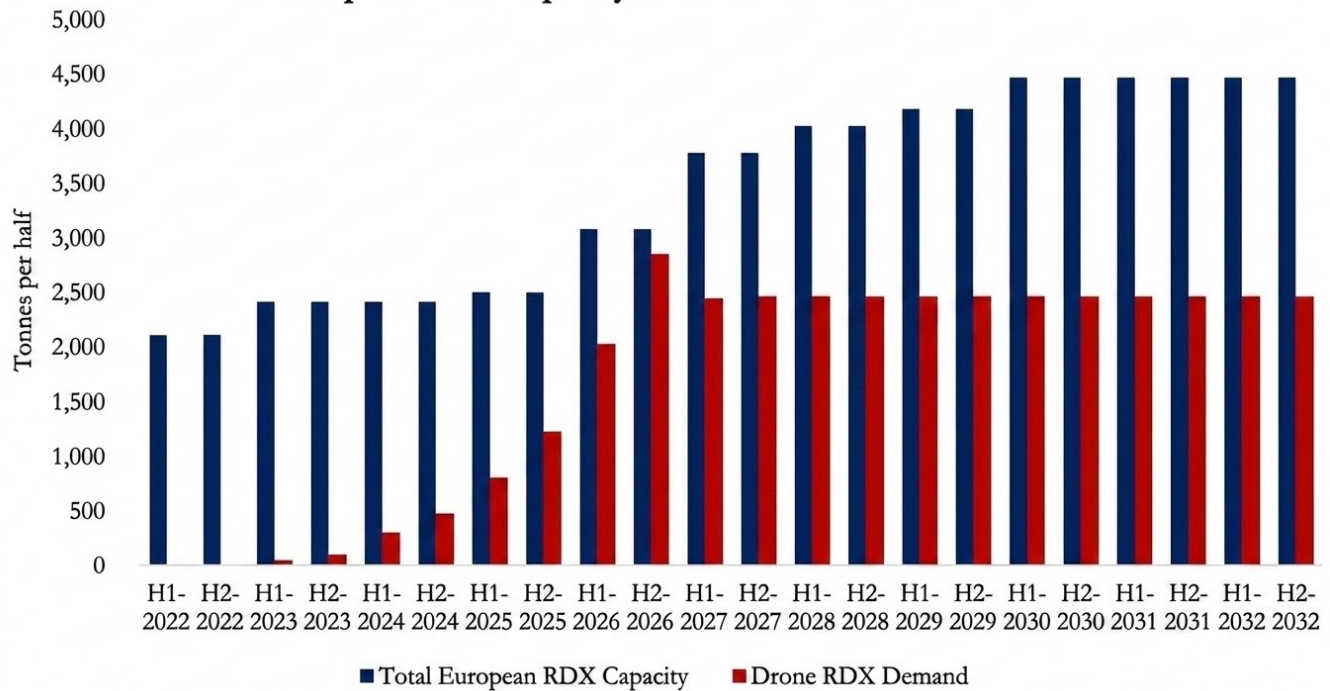

Ukraine 155mm Demand Versus Supply Slated for Ukraine

Even if our estimates are only approximately correct, Ukraine is moving toward complete self-sufficiency in artillery-shell production. Ukraine's first priority for 155 mm shells is locally manufactured ammunition from companies such as Ukrainian Armor and Ukroboronprom. The second priority is Rheinmetall. Rheinmetall is establishing a factory in Ukraine with capacity for approximately 300,000 shells per year. It has currently reached approximately 150,000 shells and is expected to expand to approximately 300,000 shells by 2027. Rheinmetall's non-Ukrainian factories represent the next tranche of supply. Only after that, if any demand remains, would there be room for Chemring, Nammo, and Diehl Defence.

As shown above, Ukraine will be completely oversupplied by the time the existing contract is completed, so there is no need for the framework to progress beyond the initial order even under a scenario in which the war continues through 2032. The second route fails as well. The IDIQ is not limited to Ukraine, and other German allies can also place orders under it, so I mapped the shell-consumption rates of Germany's allies and Europe's total 155 mm production capacity. Even after incorporating their demand, Europe remains completely self-sufficient, and the headline value of the agreement is therefore unlikely to be fully utilized. Germany has already been reducing its framework-agreement ambitions, and it recently cut the planned utilization of the Eurofighter Typhoon framework agreement by 21% despite previously targeting 100%. The uplift Chemring receives from the initial order cannot be forecast indefinitely, and once that contract ends there is no clear source of replacement demand. The next issue is that Chemring is undertaking this expansion for a single new contract while also planning a broader push into energetics. It is in discussions with the Norwegian government over one additional factory and with the European Union over another, and both would supply RDX from 2030 and beyond. Almost all of the substantial increase in RDX demand since 2022 has come from loitering munitions, and Chemring is already operating at full capacity with all residual RDX allocated to them, so even at full capacity it can supply only approximately 25% of that market. In reality its share is significantly lower, because a substantial portion of its RDX production also serves industrial customers. The most significant push into new RDX production is being made by Rheinmetall, which has already established a 1,900-tonne facility and plans to expand it to 3,000 tonnes by the end of 2027, and that 1,900-tonne facility alone covers the entirety of the incremental RDX demand coming from drones. However, this is not the only RDX capacity expansion taking place.

European RDX Capacity Versus Drone RDX Demand

When all announced RDX expansion plans across Europe are considered, Europe will be in an immense RDX glut by the time Chemring enters the market with its new capacity. Most of the production ramp-up and peak demand will occur during 2026 and 2027, while Chemring's entire new capacity during this period will be locked into HMX to fulfill a single German contract. While the graph shows the accompanying glut beginning immediately, please note that roughly 30% to 40% of total RDX capacity is slated for industrial purposes, which I have not captured at face value in the graph. The actual glut therefore comes into effect from H2 2028 onwards, when, even after reducing total available capacity by this amount, Europe remains fully capable of meeting RDX demand under even the wildest drone or loitering-munition production plans.

This makes Chemring's proposed capex plans for two additional factories highly doubtful and demonstrates that there is effectively no underlying growth available from these broader market tailwinds. Chemring has little exposure outside the Diehl Defence contract and the US rearmament of missile inventories following the war with Iran, and by the time it finally decides to enter the RDX market in 2031 the market will already be in an immense glut, leaving it with little ability to earn attractive returns on the proposed capacity expansion.

Thesis 2: Management Quality is Bad, And it is About to Get Worse

I am basing my view that management quality is poor based on the following main things I have noticed.

1. Management blatantly misrepresents Chemring's positioning in the Countermeasures segment by relying on its incumbency and presenting a 65% market share, whereas, in reality, it has lost almost all of its market share in the United States. The United States accounts for roughly 50% to 60% of the NATO market, while Chemring retains a majority market share only in Europe.
2. I am also basing this view on how management presented the capacity expansion plan. Only during the latest earnings call on 2 June 2026 did management finally disclose that the capacity expansion related specifically to HMX and RDX. Not only that, but management deliberately used wording stating that capacity could increase by "up to 275%," rather than saying that it would increase by exactly 275%. Using Norwegian environmental reports, I was able to determine that the actual capacity expansion was merely a doubling of capacity for HMX, rather than the grandiose 275% increase implied by management.

Now, as to why management quality is about to get considerably worse, this is entirely based on the fact that the current CEO, Michael Ord, who is a veteran of the defense industry and is still somewhat competent, is resigning in 2027 and making way for a new CEO called Tom Newman. Tom Newman is currently the head of Babcock International Group's Land business and has also led its Aviation operations. Babcock's Land segment primarily provides maintenance, engineering support, fleet management, equipment integration, and training services to the British Army, while its Aviation business provides aircraft engineering, pilot training, and operational support services. It is therefore mainly a defense-services and asset-support business rather than a specialized manufacturer of energetics, countermeasures, or precision components. Not only that, over a period when the UK has seen record increases in defence spend, in the specific vertical in which Tom Newman operates, his own segment's revenues have increased by a measly 5%.

On Sensors & Information

On Sensors & Information, I do not have any particular view on the segment because it is an absolute black box in the sense that almost none of the underlying contracts are publicly disclosed. While I have filed six Freedom of Information requests with different branches of the UK government and military. They have been returned with a standard answer that they can neither confirm nor deny whether they are customers for ROKE or whether they have open orders with ROKE. Therefore, I have simply taken sell-side estimates in this case. If I have any differentiation on this business segment, it is on the cost side. Roke increasingly requires highly talented and highly paid individuals, which pushes its cost base higher.

Catalysts

1. **Decline in Order Backlog:** Chemring's order backlog should decline over the next few halves as it recognises more of its existing backlog as revenue and

the inflow of new orders slows, consistent with our theses across both Countermeasures and Energetics. A decline in the backlog would cause investors to recognise that the stock has, to some extent, already peaked and would result in a sell-off, in my view.

2. **Dissemination of the SAM.gov scraping analysis:** The publication of this analysis would show that Chemring does not actually hold a 65% market share in Countermeasures.

Risks

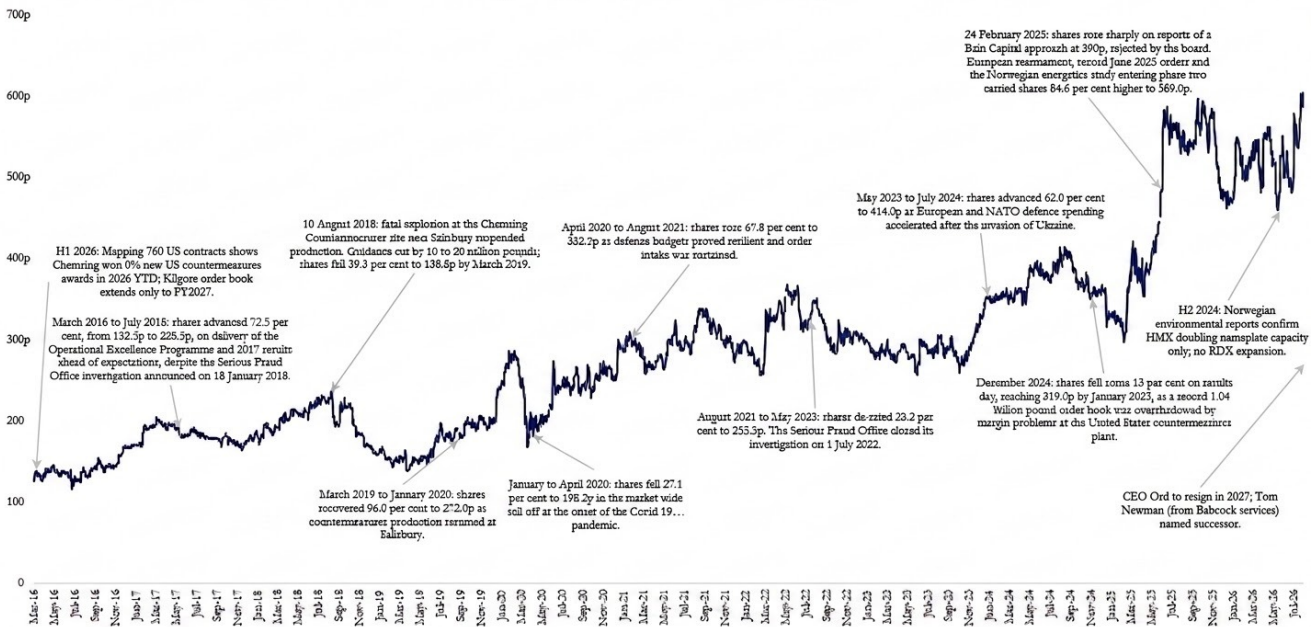

1. **Worsening situation in Ukraine:** If the current situation in Ukraine worsens further, to the point that Ukraine begins consuming more and more ammunition while also accelerating drone production, this would result in substantially higher RDX demand.
2. **Roke materially outperforming:** The second risk is that Roke materially outperforms in a way that more than offsets the projected decline in Countermeasures and Energetics. Since I have done nothing on Roke beyond filing a large number of Freedom of Information requests, with no meaningful responses so far, there is a small possibility that I am missing something significant.

Mitigants

In my view, the price currently reflects essentially all of the possible upside. While there remains a tail risk that the conflict could once again escalate into a full-scale war, there is also the risk that Roke could outperform by such a significant degree that it offsets the weakness in Countermeasures and Energetics. Both risks can be largely neutralized by hedging Chemring against a basket of stocks.

1. Chemring doesn't quote its share of awards in a given year because its awards are for multi year periods.

Chemring shuttered the pyrotechnic counter measures business you're referencing in November 2025. However, the US government actually awarded them a new contract so they are reopening the facility. Seems like you missed the closure or contract: <https://www.chemring.com/media/press-releases/2026/25-06-2026>

In addition, Chemring's Kilgore contract has been amended rather than re-awarded to run into 2027 rather than 2026 and doubled the size from \$250m to \$500m.

2. No one models 7-8% growth in counter measures. Page 27 of their investor presentation says to expect
 LSD: <https://www.chemring.com/~media/Files/C/Chemring-V3/docs/fy26-interim-results-presentation.pdf>

3. Struggle with your analysis on Chemring Nobel. Chemring Nobel serves more customers than Diehl and Nammo including Northrop and Saabs. These capabilities are so in demand that Norway is outlaying the majority of the capex.

4. Yes Chemring has significant exposure to US rearming post Iran. Chemring is on the majority of US / NATO strike and interceptor missile programs across its US, UK, and Norwegian facilities.

Alli I would be curious for any updated thoughts you have from your excellent March writeup. Obviously the macro environment has been a nice tailwind for them considering replenishment is mission critical for DoD right now.

Subject Re: Re: Think Your Facts May Be Wrong

Member alli718

Yes - Chemring is a beneficiary of the DoD missile replenishment but also the UK finally releasing the Defense Investment Plan and importantly the new Chancellor taking over the Treasury. Healy resigned as head of MOD under Starmer because the UK Treasury wasn't adequately funding the Defense Budget. Just a few weeks later, Burnham appointed him head of the Treasury! Clearly a great signal for UK defense spending. When Chemring last reported there were fears that the UK would never get its act together - those fears should be assuaged at this point.

Hi, thank you for your questions.

1. Yes, Chemring has two countermeasure facilities in the United States. One is Kilgore Flares, and the second is Alloy Surfaces. I am, by and large, referring to Kilgore Flares, which has not been shut down. The facility that was shut down is Alloy Surfaces. The contracts you are referring to in both cases are IDIQs. IDIQ stands for Indefinite Delivery, Indefinite Quantity. An IDIQ does not mean that the amounts involved are actual orders. Over the past few years, we have seen a significant shift from single orders or single-order auctions to IDIQs. How do IDIQs work? The government enters into one large agreement, or one large contract, for a substantial quantity over the next five years, ten years, etc., and then auctions that off. This secures supply for a long period and means that the government does not have to conduct auctions or introduce tenders for every new order. As a result, these orders count towards the order book and ultimately revenue when the order book is exercised. A task order is different from the IDIQ. It is the order that the government issues under the IDIQ. Therefore, the IDIQ represents the total pipeline, or the hypothetical ceiling, available to the company. Regarding Kilgore Flares' \$500 million IDIQ, I was aware of it. In fact, as shown below, it is one of the largest IDIQs offered in the

x Top 10 Countermeasures IDIQ vehicles			
Vehicle ID (Operator)	Ceiling	Remaining	% drawn
FA821321D0005 (Kilgore)	\$50,00,00,000	\$46,07,88,058	7.8%
N0010422DZV01 (Armtec)	\$45,00,00,000	\$37,84,62,374	15.9%
N0010416G0726 (BAE)	\$41,08,59,062	\$41,08,59,062	0.0%
W15QKN08D0428 (Kilgore)	\$38,29,00,000	\$36,80,62,216	3.9%
W15QKN08D0424 (Alloy Surfaces)	\$34,79,00,000	\$32,96,30,798	5.3%
FA821321D0004 (Armtec)	\$25,00,00,000	\$20,87,79,387	16.5%
N0010422DZU01 (Kilgore)	\$22,50,00,000	\$17,54,45,981	22.0%
W52P1J21D0010 (Kilgore)	\$18,95,35,807	\$13,27,33,164	30.0%
N0010405G0726 (Alloy Surfaces)	\$16,03,91,290	\$15,14,80,015	5.6%
W52P1J21D0011 (Armtec)	\$15,34,08,404	\$12,69,46,964	17.2%

countermeasure space.

However, herein lies the dilemma: an IDIQ ceiling or an IDIQ contract is never fully utilized. In fact, it is not intended to be fully utilized. It is simply a hypothetical ceiling. Most IDIQ contracts are filled below 30%. Many of the contracts above are closed and therefore are not indicative of any future pipeline, with the exception of the Kilgore contract shown at the top, which remains open. This demonstrates that IDIQ ceilings are never fully realized and therefore do not represent the total order book or total forward visibility. The image below also demonstrates this. It shows the closed IDIQ fill rates for countermeasure contracts over the past 15 years. As shown, 54% of all contracts are filled below 25%, and, on its face, approximately 50% of contracts are not filled beyond 50%. This is the key point: the \$500 million IDIQ ceiling is not representative of Chemring's order book or actual conditions. Furthermore, this IDIQ has been in

place since 2021, and since then the government has placed only a single order, worth

x	Closed IDIQ fill rates (Countermeasures)	Count	Ceiling \$	% of ceiling
	Total Closed IDIQs	85	\$3.89,73,81,508	100.0%
	Filled 99% or more	9	10.6%	
	Filled 90% to 99%	2	2.4%	
	Filled 75% to 90%	3	3.5%	
	Filled 50% to 75%	10	11.8%	
	Filled 25% to 50%	15	17.6%	
	Filled under 25%	46	54.1%	
	Total Drawn		\$1,06,55,56,158	27.3%
	Ceiling Never Realized		\$2,83,18,25,350	72.7%

approximately \$38 million, with Kilgore Flares, which closed earlier this year. While no new orders have been issued this year, it remains possible that a new order could be issued before the IDIQ closes in 2027. These orders generally take six to eight months to fulfill. However, there is no possibility of this IDIQ being utilized at a rate that affects my valuation or projections. Kilgore does not have the capacity to materially increase utilization of this IDIQ in the single year before it closes and thereby have a material effect on my valuation.

Secondly, a few words on the Alloy Surfaces \$300 million IDIQ. I believe the data discussed above is sufficient to establish that IDIQs are not actual pipelines. They are simply hypothetical ceilings, or hypothetical agreements, that the government, through the DoD, enters into to secure supply in the future. Turning to the Alloy Surfaces \$300 million IDIQ, this is more of an IP transfer than an actual IDIQ, despite being structured as an IDIQ. The issue is that Chemring's Alloy Surfaces market share in the United States has declined over the years due to DIRCM. Alloy Surfaces experienced difficulties to the point that no new orders were being received, existing orders had been completed, and there was therefore no commercial basis for continuing to operate the facility.

However, the business retained material intellectual property relating to the manufacture of flares and chaff, which is highly important to the Department of Defense. If a foreign government or partner requires production in the future, the underlying intellectual property belongs to Chemring, and it is important that the government retain access to or ownership of it. It cannot allow a subsidiary holding such valuable intellectual property simply to cease operations. To address that issue, certain minimum guarantees were secured through the \$300 million IDIQ. Because the headline value of an IDIQ is not itself economically meaningful, and an IDIQ can remain 40%-50% underfilled without any breach of contract, the facility could still incur material losses. Therefore, the IDIQ includes a minimum guarantee. I have included this minimum guarantee, which is approximately \$35 million per year, in my financial projections. The key fact is that DIRCM penetration materially overshadows Chemring's future prospects in the United States.

2. You are right on this point, and I apologize for the error. I was looking at the Deutsche screenshot and failed to notice that Countermeasures and Energetics were not presented separately. The sell-side is projecting approximately 4%-5% growth in Countermeasures, while I am projecting a substantial decline, as shown in my estimates. Therefore, although my characterization of the sell-side estimate was incorrect, correcting it does not change the material

variance between my projections and consensus. Thank you very much for pointing this out.

3 & 4. Thank you for raising these points. I am fully aware of this exposure. By reviewing subcontract data and using agentic AI in controlled research sessions to identify reporting on missile inventory increases in the United States and the EU, I was able to narrow down the specific missiles for which Chemring supplies actuators, fins, fuzes, and explosives. I have incorporated these programs into my energetics projections.

I have no material differentiation in this part of the thesis and therefore did not include it in my memo. The missile programs included in my projections are shown below. I was also able to estimate the price and volume contribution for each program. I have projected the substantial increase in production, which will continue through the second half of calendar year 2026 and through most of 2027 and 2028. This drives the increase in my estimates. As shown, my energetics estimates continue to increase. I simply do not expect the increase to be as large as the Street does. Given other HMX capacity and Chemring's own capacity expansion, the TAM/SAM is not as large as implied, despite the increase in capacity.

The missile programs I am projecting are shown below. If I have omitted any, please let me know.

Regarding the Chemring Nobel point and the company's energetics operations in the United States and the United Kingdom, I have researched this. The structure can be confusing because Chemring has three main subsidiaries:

- Chemring Energetics UK
- Chemring Nobel
- Chemring Energetics United States

None of these three businesses has explosives manufacturing capacity in the United States. Chemring previously had explosives manufacturing capacity in the United States in 2018 through Chemring Ordnance, but that facility was sold to Nammo, the Nordic Ammunition Company.

Currently, Chemring's US and UK facilities manufacture fuzes, fins, actuators, and other components across the missile value chain. They are not involved in explosives. In the United States, there is a virtual monopoly on the production of military-grade explosives, especially RDX and HMX, for US missile programs. This applies mainly to RDX, which has to go through the Holston Army Ammunition Plant in Tennessee, operated by the US Army in partnership with BAE. For HMX, capacity is insufficient, and Chemring Nobel is the subsidiary that wins HMX contracts in the United States. Outside Northrop Grumman, the usage of Chemring Nobel's HMX is relatively limited.

Yes, the Norwegian government is funding the expansion. This reflects Chemring's significant negotiating power in the relationship, given that it is the sole-source supplier to Nammo and Diehl Defence. The relevant Chemring order is worth only €234 million over the next five years. For the economics to make sense and for Chemring to achieve a meaningful IRR, the project requires state backing. Without that support, the investment would make little economic sense. Also, while I agree there is massive recurrent demand for 155mm shells, which means, down the line, demand for RDX, it is the fact that everyone else is also increasing capacity for this. Chemring's new capacity, which will come in, I guess, 2030 onwards, will be after it finishes The Diehl defence order will be by the time everyone else has also already increased their capacity.

Thank you very much for your questions and feedback! Please let me know if there is something else I should look at.

Thank you again for the thoughtful questions. BTW found your long thesis very interesting. Although I ultimately reached a different conclusion, I genuinely appreciated the way you approached the business, and after all, it your write-up was what initially prompted me to look at this business in greater depth.

I'm not close enough to this to have a strong opinion, but I found this writeup fascinating for what you were able to pull together from government sources. If you are open to it, I'd love to hear more about how you did some of this analysis and the tools you used / needed to achieve this, and to what degree you used more typical research methods (filings review / talking to company, expert calls) vs how much of your thesis was built in isolation entirely on your analysis of this data.

rii

Hi, I would love to expand on my diligence and what I did as per each thesis, which I have done to some degree below. I apologize if some of this is just a repetition of what I wrote in the earlier memo, or if it comes off as a little bit cryptic. Again, I do believe I have a certain edge here when it comes to certain stuff, but again, I have tried to be as transparent as I can on the particular details of what sort of sandboxes I had to deploy in certain cases. If you want, I would love to get on a call, but otherwise I would prefer not to talk about it in public. When it comes to typical research methods, this being a top tier defense contractor in the sense that it provides stuff such as countermeasures, specific explosives and so on, that means that not much, if any, information is available publicly. It is usually under some sort of Official Secrets Act depending upon the country. For the United States, I think I have covered most of it below. For the UK, again, I filed Freedom of Information requests, but just to show you what amount of secrecy this is, I have gotten three of my six requests back and all of them have this really nice Mission Impossible-esque line saying that they can "neither confirm nor deny" whether Chemring or Roke is the supplier for them, even though it is quite publicly available that they are actually supplying them, and it is their own revenue and Chemring's own statements. So that was the end of that, and I had to resort to all sorts of new methods.

When it came to channel checks/expert calls, I have access to the AlphaSense expert call library, which somehow has only about two calls across the history of this company, one with the ex-CFO and one other channel check who I think was at Rheinmetall 10 years ago. But that is about it. The thing is, everyone who is involved along Chemring's entire value chain and supply chain, all its suppliers, all its current employees, as well as down the line its distributors and logistics partners, either have some sort of NDA or have an indefinite NDA that they cannot talk about this anywhere, so that really blocked me in that manner. Nor do these guys have any public profiles, and I do not have access to Revelio, so again that was the end of that.

Thesis 1.1 : I created an account on SAM.gov, which provides access to US government solicitations and contracting activity relating to arms and ammunition, and also established an account on USAspending.gov, obtaining API keys for both platforms. I extensively collected prior-year Department of Defense budget documents, many of which exceed 300 pages and are extremely painful to analyze manually, while agentic AI cannot reliably process such a large volume of downloaded material at once. I therefore parsed them programmatically and extracted the exact figures required from the budget notes. Through the SAM.gov API and USAspending.gov API, I collected and mapped more than 760 US countermeasures contracts across over 20 attributes and mapped the full aircraft fleets of all four branches of the US military. I then used agentic AI in a controlled environment to collect news articles relating to future deliveries, DoD budget notes and procurement plans, combining this with government contract data to model fleet expansion and aircraft attrition through 2032. This diligence stack allowed us to construct the market and Chemring's positioning bottoms-up from underlying contracts, budget documents and fleet data. I then used vibe coding together with Windows Task Scheduler to create a daily job called Defence Countermeasures Contracts, which runs at 00:00 EDT and scrapes all newly identified contracts. The job queries USAspending by Award, filters for the PSC codes that define Chemring's addressable markets, and captures each new contract, the winning contractor, and every attribute we have mapped. The same process is applied to both contract awards and new opportunities. We also built a Python script that updates my model with these newly identified contracts, after which the data is automatically reflected in my dashboard. This gives us a significant advantage over both Chemring's own reporting and the sell side. Chemring generally issues press releases only for contracts exceeding approximately \$200 million to \$300 million, while a large portion of its order book is composed of much smaller individual awards. Very few investors monitor these contracts daily, which places us among the small number that do. There is also a meaningful lag between the date on which a contract is awarded and the date on which Chemring discloses it publicly, giving us a direct informational edge and a source of potential alpha.

Thesis 1.2: For this thesis, much of my diligence and analytical advantage came from mapping the aircraft fleets of approximately 25 of the 50 countries in which Chemring operates. Together, these countries account for more than 98% of the demand relevant to Chemring. I covered Ukraine, the United States, the United Kingdom and the European Union, which collectively account for approximately 95% of demand, alongside countries across APAC, the Middle East and Australia, which contribute a further 2% to 3%. I reconstructed exact historical fleet numbers using Cirium flight-traffic data and the IISS Military Balance workbooks, which provided detailed data on the aircraft fleets of multiple countries. IISS is the International Institute for Strategic Studies, a highly regarded non-partisan think tank whose data is effectively as good as gold.

For the forward projections, I again deployed agentic AI within a controlled environment to scrape news articles from Tier 1 institutions, military budgets and other relevant sources. This allowed me to map the stated fleet plans of the major European countries, the United States, the United Kingdom, APAC and the Middle East, including which aircraft they intend to add, reduce or phase out. I completed this work not only for fighter aircraft, but also for helicopters, transport aircraft, tankers and other military aviation platforms. Through extensive scraping of government fact sheets, military aviation sources and relevant subreddits, I was also able to determine the number of flares carried by each aircraft and the pricing of each flare. These figures were gathered from a combination of government fact sheets, news articles and US Department of Defense budgets. This allowed me to calculate and map Chemring's entire serviceable addressable market with a high degree of certainty, both historically and over the next several years.

Ukraine created a further analytical problem because military equipment is frequently pledged but not necessarily delivered. I accessed the Kiel database and used its API to scrape all military donations to Ukraine since the beginning of the war in 2022. European countries have historically achieved a delivery rate of approximately 60%, meaning that only around 60% of pledged equipment is ultimately donated. Despite this, I have assumed a 75% delivery rate in the bear case, 80% in the base case and nearly 100% in the bull case. I also reused USAspending.gov and SAM.gov to scrape all open opportunities and awarded contracts relating to DIRCM systems, alongside US Department of Defense budget plans. This allowed me to determine the intended spending on specific types of DIRCM systems for each aircraft category. Since USAspending identifies the exact DIRCM system being procured as well as if a contract is FMS and what percent is FMS, I was able to map penetration across approximately 25 countries with a high degree of certainty, particularly because most of these countries are NATO allies or European defense partners with relatively transparent procurement processes.

Thesis 2: For this thesis, my diligence stack was two-pronged. First, I again used USAspending.gov to map Chemring Energetics' US work in granular detail, including its order flow within the segment. Initially, I encountered a problem. When I first scraped the data, the order book appeared extremely small and did not show many contracts. I found only around 200 to 300 contracts, representing an order book of approximately \$20 million-\$30 million, which was grossly understated. After further research, I discovered that Chemring makes much of its money in this segment through subcontracting. Subcontracting is effectively the business model here. As previously discussed, Chemring primarily manufactures energetics and components for precision-guided munitions. It does not sell these products directly to the US government on a large scale. Instead, it sells to defense companies such as Lockheed Martin, Northrop Grumman, Raytheon, and others. I therefore began scraping subcontracting data. Thanks to the highly developed US disclosure rules governing government-contract subcontracting, every subcontract worth more than \$30,000 must be publicly declared. I was therefore able to deploy my USAspending API separately to collect subcontracting data. I ultimately collected more than 3,600 contracts and mapped them by date, IDIQ structure, contract type, and the amount of each contract that had or had not been filled. I then matched these subcontracts against their respective parent contracts. This process makes it possible to determine Chemring's value contribution per component and the amount it supplies for each missile. In other words, it directly reveals Chemring's value per missile. I conducted this analysis for the period from 2016 through 2025 and achieved what I would consider greater than 90% accuracy, except in years involving business splits, such as 2017 and 2019. I applied the same methodology to artillery, where Chemring's explosives are used, as well as to space and space-launch applications involving its initiators, and to the precision components it supplies as sole source to Martin-Baker for military-aircraft ejection seats, where I could calculate Chemring's value per seat.

The second prong is the capacity work, and this is the part I am most pleased with. Chemring's grand plan was to increase capacity at its Sætre plant in Norway by up to 275%. Given management's track record, as established earlier, I highly doubted this 275% figure and needed to examine the numbers myself. There is legitimate alpha in knowing Chemring's actual production capacities because the company does not disclose them and likely never will.

I approached the problem in the following way. They make RDX, HMX and MCX, and MCX is simply a mixture of RDX and HMX. All three of these are nitrogen-based compounds, and all three are produced through the Bachmann process. Now, going back to high school chemistry (which is not that long ago for me :), I remember this: nitrogen is a pollutant and a greenhouse gas. You have your factory in Scandinavia, in Norway, and Norway is one of the strictest countries in the world when it comes to emissions, which means companies there are required to disclose emissions data and emissions limits. So I thought of this: maybe if I could find out their emissions limit and back out into the Bachmann process, I could get their capacity. I downloaded Chemring's historical emissions data from Miljødirektoratet, the Norwegian Environment Agency, through Norske utslipp, and pulled the discharge permit itself, permit 2011.0166.T for plant 0628.0005.01, amended on 29 November 2024. And then, voila. I did not even need to perform the calculation, because the Norwegian regulator writes the production ceiling directly into the permit as an enforceable condition, in tonnes, by product. It was stated in the documents.

Please do let me know if you have any other questions/feedback!

Subject Entry Member	Great work 08/13/2026 12:10 PM avalon216
I have no particular thoughts on Chemring, but just wanted to say I really enjoyed the quality of your scuttlebutt here and explanation of the methods used.

Did you AI the model and numbers? Facts are wrong.
08/13/2026 03:52 PM
dannny

Full disclosure, not too close with the name, but I noticed the different font sizes and fonts (which has been a tell-tale when I've used it) in your model screenshots, so wanted to fact check.

Going through some of the assumptions: The overcapacity thing is just an issue of **doubling the Rheinmetall stats** (Rheinmetall line item double counts Total ex-Ukraine, which **accounts for 5-15x of the overcapacity**).

- Rheinmetall Ukraine, is (i) ramping too early (40k in FY25 even though it doesnt start production until FY26), (ii) 400k in FY2032 doesnt make sense when expansion **caps at 300k** because the Ukraine government can't pay.

- Spain (Expal) - not sure where you get 450k where I can only find 300k

- Bulgaria (Sopot) - "There is no founding agreement. There is no joint venture between VMZ-Sopot and Rheinmetall," he told reporters, adding that financing for Bulgaria's contribution had not been secured and the proposed site was unsuitable because it lacked the necessary infrastructure."

- Australia (Maryborough) - this makes bodies and are filled elsewhere (so not relevant supply)

- Czech Resell - confused on how you did this. Deliveries started in FY24, with 1.5mm (million*) - BUT THIS IS ALL CALIBRE. This is not 155mm (calibre). The only public calibre is in 2024 (which was ~1/3). So, I can call this line 3x overstated.

- Also number formatting is just off.

- you also treat the NATO target as perpetual.

Backlog

Coming to the point about my numerical grouping, please note that I bought the device I am currently using in a different country. It came equipped with MS365 using that country's numerical-grouping system. I have tried to change it, but the setting appears to be hard-coded. That is why I generally express figures in millions and hundreds of millions. In this particular section, however, I presented the numbers in full.

Using a different numerical-grouping system does not in any way imply that I used AI to build my model. I hope this clarifies why some of the figures appear to be formatted incorrectly, and I apologise if this caused any confusion. The numbers can still be read directly for what they are.

For complete transparency, I have used agentic AI in controlled sandbox sessions as a research tool to locate news articles, government contracts and subcontracts. I then reviewed the underlying sources and used them as part of my own research process. That is very different from using AI to generate my model. The model, its formulas, its order-book schedules and its conclusions were built by me.

Now, as to why it looks as though I am not projecting unallocated EBITDA, which results in me overstating total EBITDA, I do not see how this is factually accretive to my pitch. I understand that unallocated EBITDA represents corporate overhead and shared costs between the two segments. However, because it is unallocated, I do not have a differentiated view on how it should develop.

Leaving out an expense and therefore overstating EBITDA is conservative for a short pitch. I do not see how overstating EBITDA, or failing to project an unallocated EBITDA line that has historically been negative, benefits my case.

Now, coming to the Rheinmetall capacity conclusions:

On Expal, they do produce 450,000 rounds. I have attached the article below:

<https://defence-industry.eu/rheinmetall-expal-munitions-reaches-450000-annual-output-of-155mm-shells/>

On the Bulgaria Sopot plant, again, they are proceeding with this capacity. In fact, I am being conservative by not scaling the facility further and instead keeping its output flat. Please find Rheinmetall's announcement below:

<https://www.rheinmetall.com/en/media/news-watch/news/2025/10/2025-10-28-rheinmetall-and-vmz-establish-joint-venture-cooperation-with-bulgaria>

On the Australian Maryborough plant, I understand the distinction being made: it currently produces projectile bodies, which are then sent elsewhere for filling. However, those bodies are being sent to Germany, where they are filled with explosives and incorporated into completed ammunition. Even if the filling occurs in Germany, the finished ammunition enters the European supply pool. I therefore do not understand how that upstream capacity becomes irrelevant to the amount of ammunition ultimately available in Europe.

NIOA states that Maryborough is currently producing approximately 3,000 155mm projectile bodies per month for filling in Germany:

<https://www.nioa.com.au/latest-news/nioa-welcomes-rheinmetall-nioa-munitions-155mm-m795-manufacturing-appointment>

NATO itself included Rheinmetall's Australian and South African plants alongside its facilities in Germany, Spain and Hungary when discussing Rheinmetall's overall artillery-ammunition production:

<https://www.nato.int/en/news-and-events/events/transcripts/2025/08/27/speech>

I accept that Maryborough should be described as upstream projectile-body capacity instead of standalone completed-round capacity. However, it is still part of Rheinmetall's integrated production network, and its output is still being used to produce finished ammunition in Europe. I have made sure in the revised exhibit that this production is counted only once and is not subsequently counted again as separate German finished-round capacity.

On the fact that I previously projected NATO minimums on an annual basis, let me walk through what I was doing. I should have elaborated on the image I initially posted. You are right that a NATO minimum is a stockpile requirement and should not automatically be treated as perpetual annual demand. My original assumption was intended to be insanely conservative in favour of demand, specifically to test the amount of artillery-shell production that could be absorbed. For the other Central European countries in the model, I applied a minimum of 210,000 rounds. That was Germany's old minimum. Germany is the largest and one of the most populous Central European countries and would therefore be expected to have one of the higher requirements. Applying Germany's former 210,000-round requirement to every relevant Central European country was already extremely favourable to the demand case. My original assumption then went significantly further. I assumed that every country would consume the equivalent of its entire minimum stockpile every year and place a replacement order for the same amount every year into perpetuity. Imagine the conservativeness of that assumption: every single European country orders the equivalent of its minimum 155mm stockpile, utilizes the entire amount and then places a new order for the same quantity every year. It may sound slightly comical, but I constructed it that way to hammer home how much demand would be required to absorb the capacity being built.

Nevertheless, I accept the criticism that treating a stockpile minimum as annual perpetual demand was conceptually wrong. I have therefore changed the assumption in the revised exhibit from complete annual replenishment to complete replenishment every five years. This means I am still assuming that each country procures the equivalent of 20% of its minimum stockpile every year.

Even this remains extremely supportive of demand. Rheinmetall itself stated in 2019 that Germany's annual consumption of DM121 shells for training and exercises was only several thousand rounds:

https://www.rheinmetall.com/en/media/news-watch/news/2019/2019-04-08_major-bundeswehr-order

A five-year replenishment cycle applied to a 210,000-round minimum implies annual demand of 42,000 rounds per country, which remains far above Germany's disclosed historical peacetime consumption. I am therefore still making a very conservative assumption in favour of the opposing case, simply in a less conceptually vulnerable manner than before.

Even after changing the replenishment assumption from every year to every five years, substantial overcapacity remains in the revised exhibit.

Now, coming to the two actual mistakes I made: mea culpa, I made them. I apologise, although I do not believe either mistake is large enough to change the overall conclusion.

A. Rheinmetall Ukraine

I assumed that Rheinmetall's Ukrainian production would eventually increase by another 100,000 rounds. Yes, I should have capped it at 300,000.

At the time, I thought there might be optionality for further expansion. I did not research the specific mechanics of the Ukrainian facility deeply enough because the pitch was primarily about Chemring. The central purpose of this exercise was to map the supply and demand for RDX across Europe.

That was entirely my mistake. However, it is still 100,000 rounds within a production pool of more than 2 million rounds. It does not materially change the result.

The only progression I had seen was an increase from 40,000 rounds to 300,000 rounds, which led me to assume that the facility might subsequently increase by another 100,000. Again, I apologise. I did not realise that the announced expansion was capped at 300,000.

But come on: it is 100,000 rounds within a pool of more than 2 million rounds. I have now removed the additional 100,000 entirely, and the revised exhibit still shows substantial overcapacity.

B. The Czech Resale Window

You are right that the publicly disclosed figure of 1.5 million deliveries in 2024 covered large-calibre ammunition generally and was not entirely 155mm ammunition. I should have looked into the calibre composition in greater depth, and I apologise for failing to do so. However, the 155mm component of the initiative is still extremely material. The Czech Ministry of Defence states that approximately

500,000 155mm rounds were delivered in 2024. By 17 July 2025, another 320,000 155mm rounds had been delivered. That gives us 820,000 publicly identified 155mm rounds across those two periods. Again, I really apologise for these mistakes. Please, again, I would implore you guys to see reason. I beg you to consider the actual evidence before concluding that this model is AI slop. Mistakes happen, and I apologise for the confusion mine caused. They do not imply that the model was generated by AI.

In order to reduce any remaining doubt about the thesis, I have incorporated both corrections into the revised analysis.

I have:

- Capped Rheinmetall's Ukrainian facility at 300,000 rounds.
- Restricted the Czech line to publicly identified 155mm ammunition.
- Classified Maryborough as upstream projectile-body capacity and ensured that its output is counted only once.
- Changed the NATO minimum assumption from complete annual replenishment to complete replenishment every five years.
- Continued to make extremely favourable assumptions on the demand side in order to prop up the amount of production that the market could absorb.

As you can see, there is still massive overcapacity and the divergence moves significantly in my favour.

On the S&I Screenshots

Now, on the S&I part, this is one of my big mistakes, and I sincerely apologise. However, this is not a case of AI being utilized in the underlying model.

What happened is that, in order to paste screenshots of my valuation into VIC, I could not directly paste the memo, which was originally made in Microsoft Word. I had to transfer it into Google Docs. In doing so, Google Docs massively decreased the resolution of certain images, including the graphs and tables.

In the case of the graphs, you can still see the colours, numbers and general outputs sufficiently clearly. Therefore, the graphs reproduced reasonably well. However, as you have pointed out (and I must thank you very much for pointing this out) the S&I tables did not.

I used Gemini to increase the resolution of those images. In certain cases, Gemini garbled the images and changed some of the numbers displayed in them. I then failed to check the enhanced images against the underlying model before uploading them. That is entirely a mistake on my end, and I should have cross-checked every enhanced image before including it. However, AI was not utilized to build the model or produce the underlying S&I calculations. It was utilized only to increase the resolution of images that had become extremely difficult to read after being transferred through Google Docs.

I am now taking the screenshots directly from the model and pasting them directly into this response, which I believe has allowed me to get around the error. The corrected screenshots below show the actual S&I outputs under both of my cases.

In conclusion, all I would like to say is that this pitch and this model are not AI slop. Yes, I made one or two mistakes. However, I do not believe that one or two mistakes undermine the entire model or the entire pitch. Even after correcting them, I am still arriving at the same conclusion. In fact, as you can see from the revised exhibits, I am arriving at an even more dire conclusion pointing towards a worse bear case for Chemring.

I also truly apologise for the technical issue with the screenshots. I should have checked every image against the underlying model after using Gemini to increase the resolution, and in hindsight, I absolutely should have caught the numbers that had become garbled. That was a mistake on my end, and I understand why the resulting images raised questions.

I would also just ask you to look at how transparent I have been about my use of AI throughout the memo and in my previous responses. I have openly explained where I used it and how I used it. I used it to speed up certain parts of my research process, locate public sources and, in this case, attempt to improve the resolution of images. I did not use it to write the entire memo or build the model. I do not believe that using AI in this limited and disclosed manner to improve parts of the research process is against the VIC Charter, and I have never attempted to hide where I used it.

This response is simply my humble effort to explain what happened, acknowledge the mistakes and show the actual work I have done. I understand why the garbled screenshots caused concern, but I would really appreciate it if you could look at the corrected images and the revised analysis before deciding that the entire pitch is AI slop or that I should be removed.

Re: A Response to the Allegations that My Work is AI Slop

08/14/2026 09:08 AM

heffer504

I think you did some good work here with so much detail that it was probably difficult to check over all of it! I personally have no problem with your use of AI, and think you have responded to the concerns reasonably. We all have room for improvement, and hopefully this is the first of many thoughtful ideas.

Best, Heffer

I (still) think anonymous tags worsen this club - please consider making them attributable to the user who posts them

08/14/2026 09:41 AM

coffee1029

All tags such as "Member should be banned" and "AI slop" are unfortunately anonymous.

Much more useful - to me at least - are reasoned comments by alli718 and dannny. That's still plenty of anonymity but everyone gets much more context. Anonymous tags could be from someone who is thoughtful, or has hardly read the post, or is just plain vindictive.

And thanks SortinoSlayer for your rebuttal.

"Your vote will help ensure that only high-quality members are admitted to VIC."

I think, and I might be non-consensus here, that when reading a VIC member's writeup, we should have some trust at face value.

But when the FY2017 historicals & EBITDA historicals are incorrect, when numbers are incorrect (btb flipped, negative backlog, etc.), when much of the qualitative arguments seem to be factually wrong (see alli), etc., it's hard to trust the rest of the pitch given risk of (i) a lot of trust-me-bro work and (ii) anti-thesis omissions.

My point on AI was to give benefit of doubt that these weren't your errors.

Also, Sopot is casings begin 2027 (energetics in 2028), you imply that FY25 has already been in a severe overcapacity, you exclude countries in the demand side (e.g. Poland with the massive upcoming defense spending targeting 5% GDP, largest 155mm operator and procurer in NATO; also UK, Baltics, RoW, etc.). You also haven't capped Rheinmetall Ukraine.

And these are only errors that are checkable by a tourist. I can only discount and distrust the uncheckable parts.

Thank you very much, coffee1029. I really appreciate you taking the time to write this. I definitely agree, especially in the case of applicants whose pitches are being put to a vote, where anonymous tags can hold a lot of sway.

Best,

SortinoSlayer

Hi,

On the FY 2017 historicals being wrong, parts of them were restated in the following years because of the plain fact that Chemring restructured/streamlined its business lines, including Chemring Military Products, which was later sold to Global Ordnance, and its Perry Energetics business. Through Chemring Military Products, it was massively involved in providing US-standard and non-standard ammunition to the US government and its allies during the wars in the Middle East. Just a fun fact: this was the same sort of business depicted in War Dogs, although obviously not the same company :).

These discontinued businesses contributed £240.4 million in revenue and £23.9 million in underlying operating profit in FY 2017. Chemring Military Products itself was still a \$100m+ revenue line in FY 2018, albeit at relatively thin margins. I have mentioned this restatement in my model too, but the thing is, since it is included as a note, it does not show up in the screenshot. I had to restate the historical numbers to keep them apples-to-apples. Not to mention, IFRS 15 also came into effect at the same time. Therefore, the numbers in my model will obviously not tie directly to the originally reported consolidated FY 2017 numbers.

C	F	G	H	I	L	O	R	U	X
366	181	184							
Oct-16	Apr-17	Oct-17							
FY2016	H1-2017	H2-2017							

Note that this quarter is restated heavily so most, if not all numbers do not make much sense

I have answered most/if not all of Alli's arguments in my reply to them, I think. Again, if I'm missing out on something please do let me know.

Again, I sincerely apologize. Such mistakes do happen, although I should have caught them, and all I can do at this point is learn from them and correct them, which I have tried to do in full. I also hope the corrected work shows that these mistakes do not materially change the actual content or conclusions of the pitch.

On FY 2025, yes, the model is showing overcapacity. I may have started one or two factories a year or two earlier than their stated commencement dates, and I accept that. However, the main thing we are looking at is future capacity because Chemring's planned capex expansion will only come through from FY 2028/FY 2029 onwards. Therefore, whether one factory begins in FY 2026 or FY 2027 may somewhat overstate the earlier years, but it does not change how much capacity will exist by the time Chemring's own expansion comes online. I do not think moving one or two factories by a year or two affects the pitch or the eventual overcapacity conclusion.

I exclude certain countries on the demand side, including Poland and the Czech Republic, because their demand is already being satisfied through domestic or regionally integrated production. Poland produces its own shells through the state-owned PGZ group, including MESKO, Dezamet and Nitro-Chem. Under its most recent contract, several hundred thousand 155 mm shells will be manufactured in Poland, with the shell bodies forged in Poland and filled with Polish-produced TNT. Poland expects its domestic production to cover 100% of its own requirements by approximately 2027, which is the period that actually matters to my thesis.

The Czech Republic also massively produces its own shells. STV is increasing its 155 mm capacity from approximately 200,000 shells to 300,000 shells annually, while Czech-owned CSG is one of the largest medium- and large-calibre ammunition producers in Europe and supplies customers across Central and Eastern Europe. The same broadly applies to several other countries in the region. Slovakia also already produces through CSG's ZVS operation.

If I include the demand from these countries, I also have to include the corresponding domestic or regional supply. It would increase both sides of the model and remain net net in my case. That is why I decided there was no point in doing a detailed build for every one of these countries. This was not in any way an anti-thesis omission. I was simply not going to add demand that was already being satisfied without also adding the capacity satisfying it. Again, 155 mm shells are a small part of the larger pitch.

Best,

SortinoSlayer

Subject

If It helps allay fears that my work is too "trust me-bro" and cannot be trusted, PFA every single Countermeasures and DIRCM contract I've Scraped and
