2. Key Fund Data

a. Exposure Summary

During the quarter the net exposure increased slightly and the gross exposure decreased a little. As of today the fund is approximately 106% long (92% in equities and 14% in corporate debt) and has no short exposure.

% of Master Fund Net Assets				
Period	Longs	Shorts	Gross	Net
March 2010	106.4%	0.0%	106.4%	106.4%
February 2010	102.8%	-0.6%	103.4%	102.2%
January 2010	101.8%	-0.8%	102.6%	101.0%

3. Portfolio Review for Q1 2010

Visa

Visa's share price increased 4% in Q1.

Visa held its first ever investor day in March in San Francisco which three members of our investment team attended. The event was a reasonably comprehensive review of Visa's perspectives on its own opportunities, challenges and goals. We felt that the company did an excellent job of explaining its strategy to dominate the global payments system.

We learnt more about new market opportunities which Visa is aggressively focused on exploiting. Money transfer, pre-paid, international and commercial payments remain giant market opportunities. The competitive and customer dynamics in each segment vary, but the cash and business substitution possibilities are very substantial. The segments range from social security and payroll in the pre-paid space, to the substantial volumes in the money transfer market, to accounts and working capital management for small and medium sized businesses.

Visa's current global payment volume is \$3trn. In the context of this they feel the US pre-paid cardable opportunity is over \$1trn, the commercial payments opportunity is \$9trn and the cross border money transfer opportunity is \$11trn. It is very difficult to verify any of these statistics and the broader the market is defined, the less tangible the

opportunity may be, but it does provide padding to an already solid cash-plastic substitution runway.

Visa introduced and demonstrated their RightCliq product for the ecommerce space. The product is an on-line wallet, which allows one click payment for products without having to enter all your card details or personal details, similar to paypal. The simple aspect of the product is that when you want to pay on-line with Visa, if you are activated on RightCliq, you will be prompted straight to this service for one click payment. RightCliq is something of a defensive move, where it has become increasingly important for the company to improve the online consumer payment experience and initiate an online payment platform that can evolve more flexibly over time. The product is a reasonably neat fix to the consumer experience gap that had opened up with PayPal. They expect the banks to promote the product actively through online banking channels and direct marketing.

Disintermediation remains a constant preoccupation of our studies. Both mobile and online are potential channels for disruptive technologies and competitors. Visa did not allocate much time to mobile, appearing to suggest that while the group is running pilots in many parts of the world, the lack of standards and the competing agendas of the prospective parties are providing strong headwinds to a mass roll out. From our perspective we think the alignment of Visa with the banking system, the ubiquity of acceptance, and reliability of the platform are strong protections for Visa if payments do move online, but it remains an area of constant investigation.

The business trends for Visa continue to accelerate out of the downturn as retail sales have stabilised and the share of debit in the mix has risen strongly. US payment volume growth troughed in Q2 2009 at negative 3%, and global transactions growth troughed at +6%. These have subsequently accelerated to +11% and +13% respectively in December and January. Cross-border and international trends also continue to improve significantly.

Q1 saw revenue growth accelerate to 13%, compared to 10% and 2% in the prior two quarters. We expect this to move up further in the coming quarters as the reported rise in payment volume in the US, internationally and cross-border feeds through to the profit and loss account. Global payment volumes, upon which the Q1 revenue is calculated, were up only 3%. This should comfortably rise into the double digits for the balance of the year. Similarly current run-rates in cross-border volumes would imply a marked acceleration from the Q1 performance, and group revenue should be additionally supported by an improvement in the rebates base effect from the prior year (Rebates were low in H1 2009, which made the H1 comparisons more difficult in H1 2010. Rebates comparisons are more normal for H2, which will further support the reported revenue growth).

Pricing has been a strong contributor to Visa's revenue growth in the past two quarters. The major data processing price adjustment has its anniversary in the fourth quarter, but we continue to expect targeted use of this value driver over the coming few years. Visa remains a small portion of the total global system revenues (<1% by their calculation) and a combination of value share and increasing penetration should drive a rise in yields over time.

On our current estimates Visa trades on 21x 2010 and 17x 2011 earnings (on a calendar year basis). We feel the group can achieve 5-10 year compounding of 15-25pc pa based on the economic model and extended runway for growth, and it continues to trade at the lower end of what we consider to be a comfortable multiple range for the business, and clearly below intrinsic multiple bounds.

Source: Company data

Lloyds

In February Lloyds Group reported its final results for 2009 which were better than expected. The bottom line was that the company now expects to be profitable in 2010.

In the second half of 2009 impairments declined by 21% HoH, although total impairments for the year were significant at £24bn driven by the mortgage book of HBOS and corporate loans. Initial guidance for 2010 loan loss provisions were £15bn but in March were indicated to be at least 20% lower for 2010. This is the result of a low interest environment, which is reducing defaults on the retail side. Ireland remains a weak area which account for 4% group loans of which 25% are impaired without loan loss provisions. More significant losses are expected on the corporate side (40% of loan book and half of estimated losses) and unsecured loans (5% of loan book but almost 20% of estimated losses). Management however feels provisioning has peaked and states that it has been strongly declining in the first quarter.

Net interest margins increased to 1.8% in the second half of 2009 from 1.7%. This was due to lower funding costs and better asset pricing as the competitive landscape has improved versus pre-crisis levels. The number of mortgage and credit card providers in the UK has come down by more than 90% versus pre-crisis for example. Guidance is for interest margins to improve to 2% in 2010, although we could see some pressure from higher funding costs. If interest rates rise they will be more than offset by higher loan yields.

Refunding of the £157bn government support will most likely not be an issue as management is planning to reduce the balance sheet by £200bn in the next 5 years driven by sales of non-core assets and loan maturation.

Cost trends remain positive and the cost/income ratio improved by 2% in 2009, mostly on the back of benefits from synergies with HBOS. Costs are guided to come down further in 2010 and 2011 by another £2bn. This would reduce the cost/income ratio by 4% to 44%.

Given that Lloyds revised its forecast to a net profit, instead of a loss, it means that loan losses are likely to be less than £12bn in 2010. If this proves correct then Lloyds tier 1 (under the Contingent Capital Instrument definition) will not go below 9% going forward. On top of this we believe that Lloyds is likely to raise equity if their core tier 1 drops below 7%, which is the minimum accepted level by the FSA. Moreover, it is becoming increasingly clear that the new Basel 3 regulations that will be introduced over the next year will be quite punitive on banks in many ways in requiring them to hold materially

more capital and in the definition of core tier 1 and necessary buffers to the minimum tier 1.

All in all we believe that it is unlikely that Lloyds core tier 1 capital will drop below 5%, which would trigger the conversion of the CoCo bonds into equity. As a result, Lloyds Coco bonds remain an attractive investment with a yield to maturity of 11%. The bonds fell sharply during the sell off in bank equities but rebounded strongly in March and April. Somewhat surprisingly they exhibit a stronger equity market correlation than other tier 1 bank paper. This suggests that their yields will tighten as the equity market gains more confidence in the recovery in Lloyds business.

Union Pacific

During the quarter we increased our UP position to 9% of the fund and with the share price up +18% YTD it has been the single largest profit contributor in our portfolio this year.

UP is the largest railroad in America, and one of the two major railroads in the western half of the US (Burlington Northern being the other). UP's franchise extends from the West coast to around the Mississippi river, and includes more entry points to the US (ports and interchanges with Mexico and Canada) than any other US railroad.

In our previous investor letter we mentioned we expected run-rate volumes to deliver +7% volume growth in 2010 and that the risk was to the upside. Throughout the quarter, volume trends have continued to improve and YTD volumes have delivered +13% growth for Q1. In addition, the implied FY 2010 run-rate volume growth has improved to +11-12%.

We had a meeting with senior UP management in Omaha during the quarter who reconfirmed our confidence that this management team will continue to be disciplined on pricing and costs. In addition, the meeting provided us with increased conviction in our thesis that sell-side analysts continue to underestimate the operational re-bounce potential in UP's profitability with the current volume recovery. Through our assumed 1-2% long-term volume growth, together with legacy contract re-pricing and +2-3% long-term core pricing, we expect UP to deliver a mid to high teens total long-term shareholder return. We forecast profits per share rising to approximately \$7 in 2012 from \$4 in 2009, but this will be dependent on the economy not relapsing in a double dip recession, which remains the biggest risk in this investment, however the legacy contract re-pricing will help to offset this.

Coke

In a surprise move in Q1, Coca-Cola announced an agreed deal to acquire its North American bottling operations from CCE. While the recent move by Pepsi to acquire its own bottlers had significantly raised the odds of this transaction, the company had reiterated its strong commitment to the franchise model.

While it is disappointing that Coca-Cola seemed to be led into this transaction by its competitor, the current strategic rationale for vertical integration in North America is sound in our view, albeit largely defensive. North America is reasonably unique in the global non-alcoholic beverage market for its maturity, complexity, and most importantly, competitiveness. The competitiveness in particular has made it increasingly important as a competitive differentiator to fully control route to market, where the franchise system had entrenched competing self interest and lowered flexibility.

From an equity perspective, we do not feel this changes the outlook dramatically. The group's US earnings exposure rises from 18% to 24% and the capital intensity of the US business rises. On the positive side, the transaction credibly resolves some of the issues that have led the US earnings to underperform for so long, emerging market exposure

remains very high at around 50%, and the group will continue to deliver a significant majority of its volume through the franchise system.

Coca Cola currently trades on 6.3% 2010 earnings yield and has a 3.3% dividend yield. Both metrics are very high by historical standards, with the 10 year averages being 5% and 2% respectively. We feel that the strong emerging market share of the business and the acceleration in growth driven by the improving mix should continue to drive the rating back towards historical averages. Without a rerating, we think the group should achieve a consistent equity IRR of around 12%.

Oracle

Oracle is a 6% position in the fund and appreciated by 5% in the first quarter.

Most of the Street and the buy-side community remain focused on the recent Sun acquisition. We are positive on the transaction but feel the attention it has garnered is disproportionate; Sun cost Oracle \$5bn, less than 4% of Oracle's market cap. We have had recent conversations with senior management that confirmed an EBIT contribution of \$1.5bn from Sun in the first full year of ownership. This leaves us comfortable that Oracle made a good acquisition. Worries over the integration of the deal are weighing on the stock and should abate as Oracle executes.

The underlying fundamentals of the applications and database market continue to improve as corporate IT spending increases following a tough 2009. This was evident in their recent results where Oracle reported strong top line growth of 7% ex-Sun with 13% growth in high margin applications and software support. Operating income increased by 13% y-o-y. Both revenues and earnings were stronger than consensus expectations. Pleasingly we have learnt that several large deals closed shortly after the quarter ended, which bodes well for Q4. The company is clearly taking market share away from SAP in the enterprise segment. Management commentary was positive on the outlook and they are particularly excited by the potential of new products; specifically Exadata, a data warehousing solution which spans both hardware and software. The visible trend for massive structural increases in data storage and analysis capability of business is a powerful long term driver of the database business.

The valuation case is that the stock trades on x 13 our 2011 earnings estimate which captures the contribution from Sun including cost cuts. This would be around an 8pc free cash yield that can grow around 5-7pc giving around a 14pc medium term total return.

Lockheed Martin

Lockheed is a 5.5% position in the fund and appreciated by 10.5% in the first quarter.

President Obama's first full defence budget was released in early February and was supportive of the defence industry. R,D,T and E (Research Development, Testing and Engineering) and procurement (so called "investment accounts" which is where the bulk of contractor funding originates from) increased by 2.6% over 2009. Forecasts were also released to 2020 that show investment accounts growing at 2.5% CAGR from 2010-2020. While the very fast increases in defence spending seen under Bush are clearly over, declines in the budget look similarly unlikely.

Lockheed Martin hosted an investor day at their aeronautics facility in Texas that allowed us access to all management, and to see firsthand how the F-35 was progressing. The F-35 (also called the joint strike fighter (JSF)) dominated the day. The F-35 is by far the largest defence procurement ever undertaken at \$330bn and it generates commensurate media attention. Revenues to Lockheed Martin are currently modest, but ramp up each year and should make up 25% of sales by 2016.

Most media reports have been negative as the costs of the program have increased substantially in the last 5 years, which culminated in an extension of the development phase. Unfortunately, such cost escalation is common to practically all large defence procurements. For Lockheed the financial impact is small as the contract is still in a cost plus phase; all the overruns are borne by the taxpayer. The negative articles have depressed LMT's PE multiple to the average of the US defence primes, despite the huge embedded value from the F-35. We have spent considerable time with the team in charge of the F-35, who indicated that the new development timeframe is very achievable.

Recent developments have been positive with the successful vertical landing of a test plane, and the first flight of test plane BF-4, which is equipped with the full sensor pack. Despite these positive pieces of news, further delays remain reasonably likely as this is an impressive and complex aircraft, however there remains no alternative for the United States Air Force. While news flow risk remains, the fundamentals are extremely strong and valuation, on 10x '10 earnings ex pension, is very attractive. In effect, the 40pc uplift in earnings that the F-35 are expected to eventually deliver are in for free and we get an average 10pc free cash flow yield while we wait which is nearly all being returned to shareholders in dividends and buybacks.

Link Reit

In March it was announced that George Hongchoy will succeed Ian Robins as CEO of Link REIT, he is currently CFO. Chief Operating Officer Ross O'Toole also resigned in March after two years at Link REIT. Ross will be leaving following a successful search for his replacement. A number of business initiatives have been implemented, including moving from outsourcing to directly managing the property portfolio.

Despite the changes in management we find Link an attractive investment as valuations remain attractive and the company is on track, making steady progress on its Asset Enhancement Program to upgrade its shopping malls. Dividend yield is estimated to be 6% fiscal year ending Mar '11, average rent is expected to grow by 5% CAGR in the next 5 years and close to double digit growth this year. Top line growth combined with greater cost efficiencies should result in even greater profit and dividend yield growth projected to be close to 6% CAGR – we estimate the levered IRR to be 13% using a cap rate of 4%.

Given Link's low gearing, over 6x ebit/interest expenses, 6% dividend yield vs 10 year Hong Kong sovereign at 2.9% the risk return is very attractive. Especially considering the strength of the local economy; retail sales are very strong this year 8% higher YTD vs. the average in 2009 in value terms.

Wellpoint

Wellpoint is a 4% position for the fund and appreciated by 10% in Q1.

It has been a turbulent time for the health insurance companies which rose to the top of the political agenda as the democrats saw an opportunity to increase support for the bill by demonising the industry. Listening to President Obama's speeches, it would be easy to conclude that all of the problems of the US healthcare system are due to the insurance industry and that the recently passed healthcare reform bill will crush the insurers and thus dramatically reduce the costs of coverage.

The reality remains different on both points. Total healthcare insurance profits are circa \$13bn, while total healthcare spending is \$2.5trn, so health insurance profits are 0.5% of total spend. It is possible, but very expensive, for an already indebted US government to drive health insurance companies out of business by nationalising this function, but it remains an unpopular approach in the US and a public option was excluded from the bill.

The bill has many details which are yet to be finalised, but its overall impact on Wellpoint is roughly balanced.

On the positive side:

- Roughly 30m extra Americans will have health insurance, and all of that insurance will be provided by the health insurance industry.
- Tax breaks for small business and hefty fines for large businesses should help increase coverage levels.
- The government funded high risk pool and minimum mandated benefit levels are favourable.

The negatives are:

- A low individual mandate (the fine for not having insurance), which could destabilise the individual insurance market.
- The imposition of minimum MLRs (medical loss ratios- although Wellpoint is better placed here than the rest of the industry).
- Insurance exchanges (should increase price transparency)
- Industry taxes and guaranteed issue (this could hurt profitability in the individual market).

The NAIC (National Association of Insurance Commissioners) has been chosen to write the detailed rules regarding each of these points and understands the concerns of the industry. The major changes are in the individual market (this accounts for only 6% of Wellpoint's earnings). Changes in the corporate market are far more important and changes here are slight.

All the news has centred on the healthcare reform bill (or expansion bill as it should be called; there is almost no reform but \$500bn of tax and \$1tr of spend, the balance coming from medicare). However, the underwriting cycle has historically been key to profitability and all our checks indicate that pricing is robust across for-profits and not-for-profits, which should lead to margin expansion.

Wellpoint is trading on under 9x '10 PE (adj for excess cash that is announced to be returned to shareholders) versus its historic rating of 14x. We think that we will likely see a rerating as fear over healthcare reform subsides, but with no PE expansion we will still make at least a 15% IRR if earnings grow at only 5pc since capital requirements for growth only reduce total returns by about 1pc. To put this in context healthcare spending last year, despite the crisis, grew at 10pc. A \$3bn share buyback should be supportive of the stock in the coming year.

4. Outlook

The cyclical recovery in equities continued this quarter. Peoples' expectations on the economy have been battered during the crisis creating anxiety and scepticism that lacklustre economic performance in the G7 is the best we are going to get. While we continue to be defensive in our choice of investments it is worthwhile pointing out the upside scenario is one of improving profits as pent-up demand, inventory re-stocking and a recovery in capital spending and continued strong expansion in Asia and emerging markets are all feasible. In addition, we must continue to respect that as long as the cheap money stays in place it will be supportive of economic recovery and profit growth.

On the dark side, it remains clear that the massive increase in government debt to avert catastrophe and support economies cannot be indefinitely increased. The deficit monetisation likely remains the end game for this debt and deficits. The situation in Greece is a clear reminder that these risks are real and not theoretical.

We are seeing increasing evidence in the companies that we talk to, like Visa and Union Pacific, that an economic recovery in the US is gathering some real momentum. Retail sales data just released for March for the US was also very strong. This is giving us

more confidence to increase exposures to a few more economically sensitive investments which fit our criteria of strong dominant franchises.

7. Investor Relations

Q1 2010 Investor Conference Call

To ensure an effective coverage of all your questions, investors attending the Q1 2010 quarterly call are kindly asked to submit their questions in advance (by Monday 19th April COB) to the following email address:

✉ IRTeam@cliffordstreet.com

2010 Investor Conference

As a gentle reminder, the 2010 Investor Conference for TCI and for TCI Affiliates will take place at the Mandarin Oriental Hotel in New York from Monday 28 to Wednesday 30 June 2010. The TCI presentation will be on Tuesday 29 June 2010. Invitations have been sent to investors. Please note that to attend the event, registration is required.

For any queries, please contact the IR team.

✉ IRTeam@cliffordstreet.com

8. TCI Affiliated Investment Managers

a. Algebris

The Algebris Global Financials Fund ended Q1 2010 approximately 2% up on an estimated net basis.

Algebris currently manages circa \$1.5bn and is open to new investments in both their long only and long/short funds.

b. KDA

KDA Capital European Fund ended Q1 2010 approximately 6% up on an estimated net basis. KDA Capital is also considering launching a UCITS III vehicle over the next few months. KDA Capital currently manages \$300m and is open to new investments.

c. Parvus

Parvus currently manages \$2.6bn and is selectively open to new investments. For any information on Parvus, please contact Rahul Moodgal (rahul@parvustfunds.com).
